I did ask him about a some idea of a release date for a beta - saying that the Atari platform seems to be losing so many followers because of the lack of a good browser. He won't give us a date, but he said that he hopes his browser will be useful not just to Atari users, but also to Magic/PC/Mac users who might enjoy an alternative to their existing browsers.

Cheers

Paul

Apologies for the late reply - see my other posting to Lonny for the feeble excuse !!

There is no URL for this new browser at the moment. It is still rather too new for that, I suspect. If Robert would like me to post his e-mail address I certainly will but at the moment he hasn't asked me to. I'll keep in touch with him, and if he has any news, or requests for assistance, I'll post here.

Cheers

Paul

Hi

Steve Sweet wrote:

> Properly written software should be hardware transparent, taking advantage of

These are very wise words.

Since a week I am the proud owner of a 25 Mhz Milan 040.
The HD had a lot of stuff from the previous owner. Among which CAB 1.5 and
doc's and magazines in html.

This CAB program (supposed to be able to run on a 1040ST) displayed the pages
only slightly slower than Netscape on my Pentium 133. I considered the Pentium
speed satisfactory. I use 8 bit colours on the Milan, TC on the pentium.

What do you want more?
If this CAB was changed to make use of the differences between 68000 and 68040
(mainly addressing modes!) I guess it would only be a few % faster.

The important benefits of the Milan are the internal processor architecture,
faster HD and faster graphic video card. *Not* the instruction set.

Wasnt the PERQ one of the first computers running a GUI?

In the late sixties ICL sold a Fixed disc unit which contained about 24 38" or so discs. capacity: 760 Mb. I am not sure if it took half an hour to spin up.
Anybody ever heard of the MCF? Amazing stories I can tell you.

HI Mike,

>Most of my friends with PC's don't buy new machines every time
>something better comes along. They buy new machines because they are
>enticed by software as it begins to require bigger, faster machines and
>the newest operating system with each new release in order to run.
Well, I never said the grass is greener on the other side. Your friends don't really have to buy new machines. The main reason they buy new machines is to be able to use the newly developed software to it's full potential.
This is a situation which is unknown to Atari users simply because there's no such thing on our platform. The software that is available is always written with at least the Falcon in mind and most of the time the ST.
i.e Suppose Photoline would come with the same filters as Photoshop, we would scream out loud for a faster machine. The programmer has opted to include just the filters that can do the job on a Atari in a reasonable amount of time.

>Well, if we haven't the programmers to keep to with the demands of
>emerging technologies, then we really are a dead or dying platform. I
>personally don't think so, as I've seen a number of great software
>packages produced.
I'm rather pleased with what we've got right now also, but let's face it, what has been released the last couple of years that was really new? every month the gap gets bigger. Most of the software has been around for years, once a year some new bells and whistles are added...
To attract new and existing users to the Milan II, the software that is now available is not good enough... except for an increase in speed, we will still be wanting features that are now missing. A whole bunch of talented programmers have moved on. I'm not saying that the ones who still develop for our platform can't cut it. The problem is that the new modern applications can't be written by just one single person.... I think that's something of the past. The times that a 15 years old wizzkid programmed the next hit is over. Most of the new applications will require teamwork. Frankly, I can't see this happening on our platform...
How many mailers to name just one application are at this moment available and constantly updated, do we really need that many? couldn't the authors get together for a session of brainstorming, and turn out just one single brilliant mailer?

>I think we still have people able to do it. It's just a matter of
>whether or not they're willing.

It's not a matter of willing to do it, why wouldn't they want to? a
programmer isn't a walking oracle, there are limits to his knowledge,
some are very good in coding graphic applications while others are
specialised in music or whatever, put them together and something might
come out of it that otherwise none of them could achieve on their own.
Teamwork is something that softwarehouses are good at... but having to
pay a bunch or programmers is a big investment, if there's not the
slightest chance that the returns will cover the costs.... :-(

>Isn't the new Milan going to use Magic as it's OS?
According to the press release MagiC will be the OS that comes installed
on the MilanII, it doesn't mean that you have to use it. You could just
as well install MinT/N.AES or use the build in TOS.

>Also, of the above mentioned apps, the only ones that don't exist are
>the browser, the DVD player, and the drivers for a lot of PC gadgets.
I just named a few merely as an example...
That DVD player shouldn't be to difficult *if* someone writes the drivers
for the appropriate additional plugin card. Forget about watching films
on a standard 060, the latest press release mentioned that there wasn't
going to be a graphic card in the MilanII, but a chip on the motherboard.
It's nice knowing that the Milan will feature a USB bus, but where will
the appropriate drivers come from? Considering that the few drivers that
are avaible now (CD Writer, Scanner, NVDI) don't really come cheap, I'm
convinced that the USB drivers will cost us once again an arm and a leg.
The browser has been commented on before.... :-(

>Papyrus Office 8 has supposedly just been release (and in English, too),
I'll believe when I see it in the shops.....

>GEM GS has just released a new version,
Can you tell me the difference between this and the previous one? I
haven't got a clue. All I know is that it's still painstakingly slow, and
people using a HADES060 have reported that it's not exactly flying on
their machines either.

>Aniplayer and Falcamp play MP3's.
On a Falcon you can play these, yes.... what about creating them?

>This is a pessimistic attitude. I do support commercial software as
>much as possible (it's just been in short supply here in the US,
>keeping me from being able to purchase it -> No NVDI 5, no english
>version of HD Driver, etc)
What makes you think that this situation will improve? I don't believe in
miracles, do you?
I know this is not exactly what you like to hear, but face it... the only
way is down, every year some more dealers will pack it in, until finally
we'll reach a point where the only option to get software and hardware is
ordering it straight from the softwarehouse or programmer. Since most of
these are German based, it might become difficult in certain cases.
Payment with credit card isn't very popular (yet) in Germany. But in time
this surely will change. The DDP crew will translate as much of the titles

that are released, but there's a limit to what we can do of course, right now, some of the programmers don't coorporate or a softwarehouse like OXO forbids us to put a translation on the web... :-(

BTW: IIRC HDDriver is bilangual... (Uwe ???)

>I just think that if no software is made to support the new machines,
>either commercial or free, very few would be interested in them and they
>will quietly pass into history.
Then unfortunately that's exactly what's going to happen.
How many specific Milan applications are available, disregarding the fact if these are free or commercial. I'm not really aware of *one* single application, and the Milan was lounched two years ago. What's available for the Hades040 & 060? that is around even longer?

To put it in a crude way: the programmers on our platform have always supported the lowest denominator. Why are there so few STE specific applications... not even the flagship (TT) has a lot to shout about, some applications come with a version that supports the FPU, but that's it. Last but not least, lets's take a look at the Falcon... disregarding the music software (not everyone is into music) what's available that would make me *really* want that machine? a couple of graphic applications that load a JPG faster... that's not good enough, a TT with a fast graphic card will do it just as fast and in millions of coulours....

Cheers from Belgium
Dennis

From: Martin-ï¿½ric Racine <q-funk@funkyware.atari.org>
Date: Fri, 5 May 2000 01:23:00 +0300

Hi Martin-ï¿½ric,

>Ask all these people in America who have asked their dealer to
>import it and to whom Milan Ghmb never replied.
I don't have to because I'm in the same situation. Here in Belgium there aren't any Atari dealers anymore.... I can't even ask *my* dealer to import it, *my* dealer packed it in five years ago. If it's any comfort Milan has never answered any of my mails either.
What's stopping them to contact a German dealer and pay by credit card? In less then a week UPS will deliver the box at their frontdoor...
IMO it's a matter of how much you *really* want something, if I have set my mind on a certain item, then no matter where in the world it's for sale, I'll get it....
And before you comment that the Milan comes with German software and docs, yes I'm aware of it... this is possibly the reason that the Milan I is not distributed in English and French spoken countries. I agree, that this is a big problem, but to be fair; it's not only the Milan who suffers from this.

>I don't have a Falcon, but since my TT still does what I need
>(except it doesn't currently have a graphics card) I don't feel
>any need to get a Milan.
Me neither, but if you want programmers to support the Milan, it's gonna have to be sold somehow... compare it with the chicken and egg situation.

>Excuse me? The MiNT-Net CAB.OVL has always been the best of all.
I was referring to STiNG, just like the IConnect OVL, the MINT-NET OVL needs his own appropriate OS to work.

>>If you like some port of yet another obscure network utility, you're in
>>the right place. Don't ask anything else.
>
>What about aMail, aFTP and Taskbar? Last I checked, those were
>all GEM applications for MiNT.
Yes they are... if aMail and aFTP is the best you can come up with, then it's really time you take a close look at some of the MagiC clients ;-)
If you like flashy stuff and fancy soundsamples then by all means use aMail, and you've explained to us how "functional" aFTP is a couple of day ago remember?
It'll be me being ignorant once again of course, but I honestly didn't know that the given exemples are ported software ;-)

Cheers from Belgium
Dennis

ICQ is a good example, soon as some fairly stable GEM version appears I
will more than likely trash the CLI version. Quite promptly I might
add. For the momment there are a few areas where the MiNT installation
is somewhat required for certain tasks. The docs do indeed suck and
seem to be spread about, but then that may have something to do with
the fact that the components are seperate parts. I wish it was arranged
better myself. I totally agree setting it up is no easy task, however
I have found it to be quite stable and with a gfx card. There are some
small things that if you don't know it could be very unstable,
auto folder order is critical and figuring that out usually ends up
being word of mouth. Yes that is utterly a sad situation.

5586. FS: Brand New Atari Jaguar Units, Games and Accessories

Newsgroup: comp.sys.atari.st
Date: 2000-05-07 00:00:00 UTC
From: Jim Lazarenko <jim_l@NOSPAM.telusplanet.net>
Message-ID: <hohR4.6121$%u6.354317@news1.telusplanet.net>
Source record: 62249
Cross-posted to:
alt.atari-jaguar,alt.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic

To respond to this message, please use the enclosed link rather than your reply button

- Last Updated 05/07/00
- New items added, Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or shrink-wrapped/sealed titles
for:
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7 and 12 thru 20
- Rarer Star Trek Items by Playmates

5587. SCSI CDROM DRIVE PROBLEMS

Newsgroup: comp.sys.atari.st
Date: 2000-05-07 00:00:00 UTC
From: Adrian Haigh-Hutchinson <kadu.flyer@zetnet.co.uk>
Message-ID: <20000507184815685 77@zetnet.co.uk>
Source record: 62250

Help !!

Recently I was upgrading my mate's Atari by putting an extra hard drive in - unfortunately the GE Soft Adapter then ceased to recognise any of the drives at all. Solved this but the d*mned thing now won't access the CDROM at all.

The software that was setup (GESoft v3) refused to see any drives so I installed ICD Pro and then the hard drive was back - I was using ExtenDos Pro 2.4B to drive the CDROM.

I have found out that the CDROM is a SCSI-2 device -- would this be the source of the problems?

Any help would be greatly appreciated.

Thanks in advance..

Adrian tssf

Looks good! :-)

What about fitting it, same as a Nemesis or CT2 I guess - some track cutting and remove some resistors?

I have a CT2 myself, so I'm only soliciting information for anyone else who might be interested BTW.

Yes, that's right. The operating system was contained on about 6 8" floppy discs and you really needed to have magic fingers to get through the installation with no errors.

> In the late sixties ICL sold a Fixed disc unit which contained about 24
38" or so
> discs. capacity: 760 Mb. I am not sure if it took half an hour to spin up.
> Anybody ever heard of the MCF? Amazing stories I can tell you.

The PERQ I acquired was an ICL model. I think it was licenced from a US firm but can't remember its pedigree. These old fixed discs are certainly extraordinary - they behave like a washing machine on "fast-spin" and have amazing gyroscopic effects.

Roger

Anyone here remember that buzz when those disks came back from
the Public Domain library?, or that buzz when you first loaded up one
of the Carebears Megademos?, or the buzz of playing MOD files on
your lowly 512K STFM with Noisetracker?, or the buzz of getting your
2400 baud modem working and hooking up to a BBS for the first
time?. I use a PC now and the only thing thats come close to giving me
that same buzz was when UltraHLE came out 2 years ago (N64 emulator)
and playing Super Mario 64 on my PC, that "buzz" lasted for about 5
seconds then it was onto the next thing like emulating an Atari ST
(emulation
is a frustrating business and is not to be recommended, use the real thing).

I remember getting Hisofts Devpac2 on a cover disk of Atari ST User and
finally managing to sort of debug source code for the Automation Packer (I
was then able to make my own multi-game disks) - THAT was a buzz...

The thing I most miss about 16 Bit computing was the fact it was hobbyist,
you could hardly call it hobbyist now, everyone now just wants to start up a
business designing crap websites or pirating MP3's or ROM images then
burning them to a CD and selling them on, or distributing porn around the
place.... sigh... when will it end?, is there an alternative????... Is
living in the
past an alternative....?

Source record: 62379

From: Martin-ï¿½ric Racine <q-funk@funkyware.atari.org>
Date: Fri, 5 May 2000 01:41:59 +0300

Hi Martin-ï¿½ric,

>Btw, I have tried Fiffi before but, because ASH tried reinventing
>the wheel by creating yet another TCP/IP stack, instead of using
>STinG or MiNT-Net API, I have left it at that one single test.
Really?
When IConnect was developed StinG wasn't around yet, STIK could only manage
the SLIP protocol. In Europe at that time a lot of ISP were switching to
PAP. So instead of saying they've reinvented the wheel, better say that they
have given us the first TCP/IP stack that could manage the PAP protocol, and
in the best ASH tradition it's even easy to setup. ;-)
ASH using the MINT-Net API is some sort of Finnish joke I suppose?

>However, i-Connect still doesn't do PPP in a way that most North
>American servers can understand, while MiNT-Net does, which is
>why I waited until I reached Europe before I was able to test it.
That's news to me.... I suppose that North American IConnect users are just
one lucky bunch, having picked the right ISP merely by coincidence?
Could you possibly explain this, I really like to know what causes this.
What's so special about The MiNTNet API that American ISP prefer it?
In my experience PPP 1.8 works on every server supporting the SLIP and PAP
protocols. So far, I know of only one person that couldn't manage to make a
connection. It's with the English Znet ISP, in the mean time I know someone
who's on Znet with IConnect, so clearly the problem is at the user's set up.

Over the years I've helped several people here to go online, using IConnect,
regardless where they lived. "Helping" is not exactly the right expression,
it's merely showing the way, a child can do it. Some are confused thinking
that they need a script file like with STinG or that other stack...
IMO if one can't connect with IConnect to an ISP, he may just as well forget
it.... if it doesn't work with IConnect it surely will not work with the
other stacks either including MinTNet. Even if someone doesn't want to use
this stack, I still advice to install it, if the connection can't be made
with IConnect, then you might just as well start looking for another ISP,
because the other stacks will not be able to access it either.

>> I'm not going to start the discussion about the way it looks and
>> the poor WDialog compatibility which IMHO are crap.
>
>Even under SingleTOS, Wdialog is crappy enough to randomly crash
>everything, as I experienced way back on the STE.
Has it ever occured to you, that this may not be the fault of WDialog, but
of the poorly implementation of the system calls in certain programs? I must

be extremely lucky, because in all these years WDialog has never randomly crashed here..., but I *know* how to make it crash using certain programs, and I *can* reproduce it time after time, it's the program that is to blame not WDialog.
If you don't like it, don't use it.... after all the purpose of WDialog is to add MagiC compatible AES-extensions to TOS. I can't imagine you liking that sort of thing to start with. There will be certain applications that don't function anymore, but that should be the last of your problems. Since these applications are not written "conform" the standards, I suppose you don't use them to start with :-/
Not so long ago, you wrote here that the WDialog routines in N.AES are 80% compatible. What kind of statement is this? Either it's compatible or it isn't. 80% in my book means poorly implemented. Whenever things crash or don't look right you can blame that 20%....

>> I've now installed the KEMD package and MinTNet once again,
>
>I cannot remember how many times I have said it recently:
>most people only need MiNT-Net and N.AES. Period.
Sorry, but there's a difference between the things that you are rambling on about and actual life... you know what is missing, don't you? Docs.... I've been struggling with N.AES for two months now. I wouldn't call myself a inexperienced user, but despite the (poorly written) docs, I can't get it running *stable*.... KEMD may have it flaws, and it's ageing, but once it's installed, it's solid as a rock...
I can't wait for the Neuss Messe and show how easy it is to bring the whole N.AES system down, that N.AES needs a lot of more work regardless what you and others claim. Anyone claiming that it's solid, needs his head examined or doesn't have a clue what solid stands for.

>Why bother getting a Milan, if it is only to run Linux. might as
>well buy a cheap PC. However, if what you want is a GEM box that
>is expandable and technicolor, then by all means, get a Milan.
I'm not the one who's constantly bragging about the possible LINUX/UNIX ports to MiNT remember? I already have a expandable GEM box with a nice fat graphic card. The difference is that I actually use it for what it's been intended... running GEM programs.

Cheers from Belgium
Dennis

>I pretty much agree with all you said.
>I just don't want to be lumped in with some stereo type that all MiNT
>users like and use CLI's. Simply is not thecase with me. ;-)))
Sorry Lonny, I didn't mean to that all MinT users like and use CLI's. It just goes beyond me why anyone using an Atari regardless of the OS used would possibly want to use a CLI based application when there's a GUI alternative available.

This newsgroup is read by experienced and inexperienced users, even people that don't have a clue may well follow it. A very small minority is praising the UNIX/LINUX ports here lately.... I`m not implying that these are useless, they may well serve their purpose. But it's not a general trend, these ports don't make any use of the features that sets the Atari OS apart from other computers. I for one don't want to be warped back in time twenty years...
If one really is so wild about these applications, he should install NetBSD or Linux, and let us get on with it. If the application isn't available for the m68k compilations, well he can port it over :-)
The NetBSD and Linux community surely will be very gratefull...

Date: 4 May 2000 21:08:35 GMT

Hi Jo Even,

>..an incredible amount of things I won't comment because we've been down
>that road many times before. Please shut up everybody.
:-)))))), yes indeed we've been down that road before, but the difference
is that this time I fully agree...
Considering where we stand after 15 years Atari, reading all these posting
from different people not being content with what's available. Wanting the
most incredible stuff to run on their ancient machines, and realising that
none of the existing commercial softwarehouses is able to deliver... then
the only conclusion left is to follow that other road...

Since according to what I've been reading here MinT is now the most popular
and widely used OS <sic>, I'm really looking foreward to see the first fully

developed mainstream MiNT applications appear. After all, it's the market
leader who sets the rules and leads the way... I really wonder where that
way is going to lead us.

>If somebody buys a Milan II (which most likely only will be sold in very
>small numbers in Germany and only to personal friends of the
>manufacturers) to run Linux they're mad. Idiots. Get a PC that's cheaper,
>many times faster and runs the same OS but with much better support. I
>mean it.
For the first time in many months we actually agree on something :-)

Cheers from Belgium

Hi Galen,

>>The Milan 1 is on sale for two years, it's available from stock right
>now, but nobody buys it... why?
>Two reasons: First, I'm not convinced 25Mhz 040 is that big an
>improvement over my 16Mhz 030.
It depends on what you're expecting...
Processor speed doesn't say it all. If you install a graphic card on your Falcon, the perception of speed increase will be much higher then when you install for example an After Burner.
Compared to the standard Falcon the Milan040 will be more or less 5 times faster, but because of the graphic card some of the applications will seem to fly. Applications that use the DSP will possibly still be faster then even a 060 can manage. It's not easy to explain, you should be able to see it, so you can compare it yourself.

>Secondly, I can't buy it at all unless I somehow recruit someone in
>Germany to send it to me -- there's no online ordering and no N.
>American distributor. I don't even think there's a distributor who
>speaks English!
Milan doesn't sell directly to the public, IMO this is a mistake, but I suppose they have their reasons (whatever these might be, they should review them ASAP).
One of the biggest Atari dealers in Germany, takes credit card orders and ships worldwide. I personally know someone living in India, who bought his Milan this way. In less then a week UPS delivered it. The problem of course is that *everything* including the docs and keyboard are German. If you need help or additional info you're out of luck, unless you can get it here :-)
Supposing something breaks down that you can't repair yourself, the whole lot has to be shipped back to Germany....
>
>Now, if the Milan II (??Mhz 060) manages to be able to run most
>Atari software and isn't as expensive as a Hades (say $1000 -
>1500 USD?) I'll learn German myself if I have to!
The Milan II is still *vapourware*, there's not even an official release date set for it. Except for the people developping it, we're all just guessing.
We should keep in mind that Milan can't be compared with Atari. We're talking of a very small firm here, which probably doesn't have the knowledge, resources, experience and the cashflow to be able marketing the Milan worldwide. They've learned from their mistakes, instead of

marketing it themselves, they've called in Axro.
Axro is a very big distributor in Germany, but I don't think that they have the resources and knowledge either for a worldwide distribution. The guy in charge of marketing doesn't even understand English!!

Somehow we all tend to think that Germany is the place where Atari is still really big... it isn't, there are only a handfull of dealers left, and they are struggling to keep their business going. Thanks to Axro the MilanII will be on sale in hundreds of places, including some of the most popular warehouses. But this may well kill the few remaining Atari dealers.... If the MilanII doesn't become an instant success when it's lounched in Germany, I don't think that an "international" version will ever appear.
I honestly hope I'm wrong, but I just can't see how they are going to attract new customers. Who is going to buy it and why? if the average German customer sees the Milan running Draconis Pro, he will run away screaming out loud and get himself an iMac... the software neither the hardware is up to todays standards, we might get exited by the thought of an 060 but don't forget this is regarded as old crap in the market place... and TBH it is :-(

Milan IMHO goofed terribly... announcing a new improved, more powerfull product will kill off the sales of the existing machines. Who on earth would possibly buy a Milan040 now, knowing that the 060 is supposedly just around the corner?

>Frankly, that's what I'm looking for. I know new features are
>nice, but they come slowly. Even if they stopped coming I'd
>still use my Ataris as a second computer system.
Why buy a brandnew computer that comes with a price tag that is just as high as a PC or iMac, and then having to use it as the second computer system? You could just as well use your current setup. Or... be really drastic and install the MagiC emulator on the PC or Mac.

>>So... who's going to get rid of his ST, MegaST, STE, MegaSTE,
>>TT and Falcon and get himself a Milan???? today... not tomorrow !!
>>and don't forget to support commercial software because that's where
>>our only hope is.
>Points well taken. The credit card is being brushed off and
>readied for some more software this week.
I'm not holding a crusade against public software... but since they show no incentive at all to support the new machines, I think the only option left is to support the commercial market and hope they will.

Cheers from Belgium
Dennis

I think that's a very pertinent point. Back when I was setting upi my
business, I was running on a Mega4ST and a Mega4STe. I needed more ram
and tried getting a TT out of the States, but in spite of bext
endeavours Sheldon was unable to source one for me. Chris at Computer
Direct in Canada offered to build me up one of his clones, but I had to
look at the logistics of repairs and support from that far away.
Comparable hardware and software was about the same on the Mac as what I
was looking at on the Atari and with the benefit of MagicMac, I was able
to achieve an easy migration across on a Quadra 950.

You'd really have to be pretty committed and have spare dosh to blow to
look at committing further funds of any significance to the Atari cause.

Having said that, my Mega4STe still keeps bashing away and has long
since paid for itself.

> > support HTML 4, CSS and Javascript.
>
> Also excellent points.

Agreed entirely. I'm learning Javascript and find it embarrasing
that I cannot test my efforts on my beloved Falcon030. I also find
there are fewer Websites that do NOT use at least some small bit
of CSS, HTML4, JScript (pah!) or Javascript (or Java, Quicktime,
realaudio, MP3, etc...for that matter!)

> > Beyond that, Atari applications (or freeware ports to MiNT) do
> > everything I need.

It seems the Atari platform has fallen behind of late in areas that
require some form of licensing to delve into. Javascript is a prime
example, with the $10k US odd dolleros required to create a licensed
version of the software...

I guess a hobbyist platform WILL fall behind in this day and age of
corporate gluttony...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

> the SLIP protocol. In Europe at that time a lot of ISP were switching to

STiNG use the same API as STiK, so the APIP was already defined. And
MiNT-Net had been around for years.

> PAP. So instead of saying they've reinvented the wheel, better say that they
> have given us the first TCP/IP stack that could manage the PAP protocol, and

Don't mix up TCP/IP and PPP, that's two different things. I don't know why
ASH (or whoever made that decision) packed everything into one package,
it's so entangled that it won't even work with a nullmodem.

> ASH using the MINT-Net API is some sort of Finnish joke I suppose?

I don't think you understand the term "API" at all. I can't see why
IConnect couldn't use this API, in fact this would make more sense than
the current implementation. But I fully understand why it wasn't used - it
would allow people to use their apps without paying for their OS and
TCP/IP-stack. And they know that people tend to use free stuff whenever
they can.

> What's so special about The MiNTNet API that American ISP prefer it?

Again, look up the term "API".

> it's merely showing the way, a child can do it. Some are confused thinking
> that they need a script file like with STinG or that other stack...

If STiNG or MiNTnet needs a script, so does IConnect. The only difference
is how you write it.

> Has it ever occured to you, that this may not be the fault of WDialog, but
> of the poorly implementation of the system calls in certain programs? I must

No. If this was the case, then it's a miracle than *anything* works. Why
should programmers use WDialog in an "unstable manner" when they're
perfectly able to use ordinary AES-calls without problems? Dennis, you're
not a programmer, don't pretend to be one either ;-)

> Not so long ago, you wrote here that the WDialog routines in N.AES are 80%
> compatible. What kind of statement is this? Either it's compatible or it
> isn't. 80% in my book means poorly implemented. Whenever things crash or
> don't look right you can blame that 20%....

Exchange the word "compatible" with "implemented", and you're on the right
track. Not everything in WDialog is implemented in N.Dialog (after all,
it's version 0.52 or something), like the printer-dialog. Those things
that *are* implemented works, and they also work with memoryprotection
(and later on also with real virtual memory).

> I can't wait for the Neuss Messe and show how easy it is to bring the whole
> N.AES system down, that N.AES needs a lot of more work regardless what you
> and others claim. Anyone claiming that it's solid, needs his head examined
> or doesn't have a clue what solid stands for.

This is just plain stupid. Replace "N.AES" with "MagiC", "TOS", "Linux",
"MacOS", "NT" or whatever and it would still be perfectly valid. There's
simply no such thing as "idiot-proof". N.AES 2.0 hasn't crashed on me
since I corrected that horrible standard-configuration. I know a lot of
people that use it, and "unstable" is not their most commonly used word
about it. However, I can easily make it extremely unstable if I want -
e.g. by installing WDialog and run Jinnee 2.0. Using your logic that must
mean that Jinnee is poorly written and makes poor use of the AES...

> I'm not the one who's constantly bragging about the possible LINUX/UNIX
> ports to MiNT remember? I already have a expandable GEM box with a nice fat
> graphic card. The difference is that I actually use it for what it's been
> intended... running GEM programs.

You simply don't get it. I won't bother trying to explain why some idiots
like myself use our keyboards for other things than ranting on usenet,
because you can't see beyond the colours and grasp the difference between
presentation and functionality.

If I have a GEM-program that does the job best, I use that. If there are
CLI-tools that's better, I use them. That's why I write code with QED and
compile it with GCC. QED is better than most CLI-based editors I've tried,
and GCC kicks the sh*t out of PureC.

But it would be nice for the graphics to be simplified, then we are not stuck looking at the [Alt] tags, but could see some version of the graphics.

There is also a site to "buddy" certify your web pages so they are accessible to alternate web browsing software such as screen readers for the blind, but I don't see too many people adopting that either.

A proxy solution is probably the only way I'll ever be able to browse the web with graphics on my 800XL also!!

I ran into Nevlyn on IRC the other day, it indeed is is the
same person. At some point the project picked up a name
and I didn't make the connection. You should try IRC sometime
as directly chatting really feels way different than usenet.
I find that on IRC I get way more done in realtime and you
might find more developers there than you'd think.
It's also just plain fun sometimes. ;-)

Both StinG _and_ MiNT-Net _were_ already there when i-connect
came. MiNT-Net could already do PAP at a time when CAB had not
even appeared yet.

> if it doesn't work with IConnect it surely will not work with
> the other stacks either including MinTNet.

You really don't have a clue what you are talking about, do you?
MiNT-Net worked on the first attempt, i-Connect (at a time when
the beta was still called PPP-Connect) never worked.

> N.AES system down, that N.AES needs a lot of more work

Anyone claiming otherwise needs to learn how to properly setup
their system. N.AEs has always been _rock_solid_ here. Always.

You'll find the VGA-801 at www.mat-co.com. Their email address is info@mat-co.com. And no to the other question. But it should be no problem since VGA-801 has AV, S-VIDEO and VGA inputs (and a button to choose) and works with NTSC and PAL.

One last note,

I have a US model Mega ST2, is there an issue with these boards running on an NTSC machine?

That's not a technical issue, but an economical. DVD-licences are *very*
expensive.

> are avaible now (CD Writer, Scanner, NVDI) don't really come cheap, I'm
> convinced that the USB drivers will cost us once again an arm and a leg.

Again, this is an economical issue. Hardware-vendors doesn't hand out
the necessary specs just like that (well, most don't).

>>Aniplayer and Falcamp play MP3's.
> On a Falcon you can play these, yes.... what about creating them?

No problem, several converters has been available for a long time. You
have to type though ;-)

> What makes you think that this situation will improve? I don't believe in
> miracles, do you?

I don't. I've stopped buying commercial software, most of it is only
available in Germany (unless you want to pay twice...) and German dealers
are generally not reliable. They'll take your money (you must pay in
advance ofcourse, no credit card or COD.) and if you're really, really
lucky you'll receive something (usually not what you ordered and quite
often defect) 6-12 months later. After a lot of hassle. Thank God for
free/shareware, compilers and opensource ;-)

5628. Re: MULTISYNC MONITOR

Newsgroup: comp.sys.atari.st
Date: 2000-05-08 00:00:00 UTC
From: Chris Martin <hacked_up_radio@yahoo.com>
Message-ID: <39174408.A60CC4B5@yahoo.com>
Source record: 62274

Actually, there are monitors being made today that can sync as low as
15Khz. Although, not from the source you may expect. These monitors are
made for arcade machines, not computers.

Check out the following link:

http://www.happcontrols.com/gaming/monitors/49132900.htm

Granted that this monitor is only the tube with no casing, but it is a 19"
monitor for only a little more than $200. They have others too.

Now, I know you can connect your ST up to one of these things, because I
have a 520ST and a full-sized arcade cabinet with a 25" monitor in it
at home. After noticing that the arcade monitor has the
same specifications as my Atari monitor, I built a ST2Jamma
connector, and connected my 520ST up to the arcade cabinet.

I also connected the 520ST audio and joystick ports up to the
cabinet as well. This makes for a really cool gaming platform, not to
mention seeing the desktop on a 25" monitor is something else. (I got the
whole cabinet for $275; beats blowing $1000+ on a 21"+ monitor.)

If anyone is interested in the circuit diagram for this thing, drop me an
email,
and I can put it up on my website. The circuit is fairly simple: it only
takes one
IC to create a composite sync. Though, this may actually not be needed.

The recent speculation is that they figure it won't be long until they have
a virus together that will cause trouble with simply PREVIEWING the message.

I knew there was an advantage to not using a PC as my main computer.
(Managed to avoid getting one to this point, and I plan to keep it that way.)

This is a real problem. I need the thing to have a U.S. (or at
least English) keyboard and desktop or my wife will complain
long and hard (she's FINALLY used to my Falcon's English
keyboard). To be honest, shipping something back to Germany
isn't a problem, provided I can talk to them. If that Atari
dealer speaks English, it wouldn't really be that different from
ordering from Great Britain, which I've done several times.

Partially, I'm just stubborn. Secondly, my PC is at work, not
at my house (a PC Free Zone). MagicMac is darn intriguing
though, and Magic is mature enough to be relatively decent. If
no Milan II comes, that'll probably be my choice.

I guess the next challenge would be writing a SMB protocol for
the ST, so we can do File and Print Sharing with Windows. Or,
is one already in existance? I've heard of a TCP/IP protocol
for the ST. Of course, I just have my little 1 meg 1040st, so
I've never tried it. But, just thought I'd put out the idea.

This was an early UNIX like operating system that was advertised in early ST mags. It has a following in heavy duty business apps on other platforms, but never really took off on the Atari platform.

Well, we have converted the book into the ST-Guide .HYP format two years
ago. That time Scott had forbidden us any distribution.
Nowadays he is saying that he is going to publish the whole thing on the
WEB. It should be done in a few weeks (in his words).
We are just hoping Scott will make it really public and will allow us to
publish the .HYP version recently maintained to conform the MiNT
documentation. The other extensions (MagiC, NVDI, OLGA, AV, etc.) would be
probably better to make as a separate .HYP files with @uses COMPEND.HYP
command to allow the crossreferences (but this is only the future music).

best regards

>> Unfortunately, most web site authors write to "a browser"
>> instead of to "the standard" (<http://www.w3c.org>, I think.
>> Or maybe it's .com....) which is the root cause of the
>> problem.

Yes, this is, I think the really solution! Follow the W3C and use its standards.

Here, in Czech Republic's Atari mailing list is the browser development discussion about how to make such thing and which OS it should support. The resulting idea is in my opinion as follows:

OSes:
MiNT + Threads
cause: already ported libwww from w3c, which would reduce the browser problem a lot.
MagiC?
solution: port the libwww to use it with MagiC and everything should work.

Other thing is the rendering machine... It should be highly module divideable (possibly .SLB as the standard PlugIn interface) architecture to allow the whole programming distribute all round the Atari scene. We should definitelly go into the Amaya (Mozilla, CAB? (Alexander's will and or trust to developper team?), and other browser sources)
Here my question is: Is the Highwire capable to run on both OSes and or is there a possibility to write e.g. my own JPG -> monochrom module (could be written in really efficient way to the standard workflow like unpack the whole JPG (all colors) and then dither the whole thing) instead of the default one (or none in the beginning).
There can therefore be some kind of language PlugIns like JavaScript and other. Concerning this there is also need to propose such a good and flexible, but FAST, PlugIn interface.

What do you think about these proposals?

Hi Martin-ï¿½ric

>>One could argue that the Milan is the first MinT computer, but even
>>the MiNTcommunity doesn't support it... not in a proper way that is.
>
>#define proper way
Since the Milan has been sold in such small numbers, the commercial
softwarehouses don't support it. For once the MiNT community had a
chance to proove, that public software *really* is an alternative, but
instead of coming up with some nice ported applications, which could
possibly attract more people bying a Milan and using the MiNT OS, like
usual a lot of wind... but nothing else. The Milan is a lot faster then
the Falcon or TT, so some ports should run relatively fast on it. Not
to mention the Hades060.....
The people that spend their time programming and porting stuff for
MiNT, don't seem to have a clue about what the users want... or is it
me who got it wrong and are the endless stream of network ports exactly
what the MinT user is asking for?

Providing a fast serial driver is not what I call "the proper way" of
supporting a machine. MagiC didn't become a succes because it could do
multitasking relatively fast, it's popular because of the applications
that take advantage of it. What's the use of having a powerfull OS if
there's nothing around that even remotely uses it?

Have you ever asked yourself why Milan users have bought MagiC-Milan?
why pay a lot of money for a OS, when you get the best one free? are
these people morons? or could it be that they were fed up.... waiting
to even have the chance to go online at a decent speed?

IMO the MiNT community should have jumped on the Milan like a bunch of
wild animals, but instead of jumping, they sat there and looked at it.
Well, you know the outcome.... the next Milan will come with MagiC as
the main OS.
Isn't it ironic that ASH have to take over where MiNT left of? if there
has ever been a chance to make MiNT acceptable to the general public
this was it !! people tend to use the OS that comes with the computer,
one has to be very disappointed in it or a be a real fanatic to buy an
alternative one.

#definition of the proper way => SUPPORT, SUPPORTS, SUPPORTING, SUPPORTED

Cheers from Belgium
Dennis

5652. [NEW] Updates of May

Newsgroup: comp.sys.atari.st
Date: 2000-05-09 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <391807AE.DBD7E79A@ief.u-psud.fr>
Source record: 62298

Hi all,

I've updated my homepage. First, there's a new release of Persistence
Of Vision 3.1g (POV). This is a famous software for 3D rendering. This
3.1g version was allready available on my WEB page. What is new for
this release is that's built with the latest GCC version (2.95.2),
and therefore we can obtain a descent 68060 version.
I also corrected a forgotten bug from 3.1g UNIX (my sources), that
prevent some vertex to be drawn in case of sharp normals.

Second, I placed on my page May release of Eureka (rev. 005).
It's a 2D Graph Describer and a 3D Modeller. It used to be
part of CyberStrider Scheme, but now D. Bhabuta seems to
have other interests. I thank him for his strong activity
during these long years (does anyone reminds of the famous
Hensa Atari server ?).

Have fun !!

Bye for now ...

What in the zarking photon is wrong with Milan? When they first brought
up their website and they had the list of Atari support throughout the world I
summitted the information for Atari support in the Dallas, TX area probably
three-four times with no responce.

It really appears to me they made a computers for a short amount of time
to the tune of about 50 a month. During that time they put updates to the
Milan OS and did an awesome job. But it seems they became overwhelmed since
many have written them without replies.

In light of this, I'm starting to consider a Milan less and less and a
upgraded Falcon/TT more and more. (Maybe a Hades?)

Seems the best there will be.

MagiC applications are always GUI oriented wonders which are
visually pleasant, this is true.

In MiNT's case, the current trend is to provide a rock-solid,
fast OS with all the networking goodies one needs, which usually
means CLI freeware tools.

Bear in mind that, because no advanced AES is included with MiNT,
most of MagiC's flashy ideas cannot often used. Take aMail: it
uses icons, looks cute, covers many character-sets, but the look
is not quite up to Magic standards.

However, once aAESis or xAES are fully developped into a stable
state, this will quite likely change.

news:8f4lce$9fd$1@uranium.btinternet.com...

: Anyone here remember that buzz when those disks came
: back from the Public Domain library?, or that buzz when
: you first loaded up one of the Carebears Megademos?, or
: the buzz of playing MOD files on your lowly 512K STFM
: with Noisetracker?, or the buzz of getting your 2400
: baud modem working and hooking up to a BBS for the
: first time?.

Yeah, it was more magical back in those days...

My first buzz, as you call it, was when I sat the whole night with a friend who had borrowed a (then) very expensive Mac+ from his cousin. I had made a null-modem cable and we wanted to transfer over fonts from the Mac to the ST. We were both completely green and didn't really know what we were doing. Finally, in the early morning hours, after 7 hours work, we broke thru. We had to push the SEND button on the Mac *before* we pressed the RECEIVE button on the Atari... This was discovered by accident.

Today it would be ridiculous to spend so much time with such a trivial task, but it was the first time I had made a nullmodem cable, the first time we both used a comm program, our first time hands-on experience with a Mac etc. We knew omething was wrong, but what? The cable? The communication procedure? Us?

To repeat the feeling today I'd have to try and program a japanese video by reading the idiotically translated manual in only Swedish... (The trick is to read it in all languages you have an inkling in, and then make a summation of it all in your mind.)

It would be a great start for me if MiNT was maintained in a manner that an end-user like myself could dowload it, be reasonably assured that the download was the current state of the art version, click on install, and be running it.

Dennis Vermeire wrote:

Why are you editing the script file ?

With the last 50 versions of STinG, this is not necessary. Check out the
Quick FAQ for instructions on installing and setting up the latest version
of STinG.

I've often wondered that myself, as I saw a hades060 in person at
a MIST show and frankly was totally amazed by it. That was
some 2 or 3 years ago the hades060 was out. If you mention hades
people will tell you it's to pricey or it's missing DMA this
or that, yet it exists and I know people who have them and love
them and won't let go of them, I might add. I've wanted one since
but ain't got the nerve to order it overseas.

Extendos reports that the cd-rom is there and assigns it to be drive
P on the desktop (as setup in extendos.cnf)

I'm using ICD Pro as the driver for the SCSI drive!!

The SCSI tester prg with ICD Pro shows that there is a cd-rom there
on lun 0 id 7 but we cannot read any cd-roms in the drive -- the
drive shows as there but we cannot access it !!

Any thoughts? It's a NEC 502

O.K, Since you have Extendos running last in your Auto folder, conflicts regarding RAM are not likely. From what you post, everything is running O.K. EXCEPT that when you double-click on the "P" icon on your desktop, you get an error of some sort. What IS that error message?

Bad cabling or improper termination seems the most likely possibility. A few things to try:

1)Turn OFF the hard drive and attempt to boot the CD-ROM off of floppy. What happens? (Configuration problem test)

2) Disconnect the hard drive and connect the CD-ROM directly to the LINK. Then attempt to boot off of floppy. What happens? (Termination test)

3) Open up your CD-ROM and verify that it has termination on and parity off. (---)

4) Try a pass-through terminator instead of the built in. (One of my NEC CD-ROMS -- can't remember the model right now -- did NOT adequately terminate with the termination switch on. After months of frustration, a friend with a $10 pass-through terminator had the system up in 10 minutes. Your mileage, of course, may vary. (Termination test)

5) Try to get the CD and HD working with everything possible off. Just have ICD and EXTENDOS active in the Auto folder and no accessories. (Configuration test)

6) Use the HD cable on the CD and vice versa (cabling test).

>
It's a jumper on the drive. On my new CD-R the jumpers were
SCSI ID 4pts
SCSI ID 2pts
SCSI ID 1 pt (the above three get you settings from 0 - 7)
parity (this is the one I pulled)
unused (for testing at the factory)
termination power (activates +5V? on one of the pins)
termination (activates the internal termination resistors)
auto-spin (gets the drive spinning when turned on rather than
waiting for a command).
Of course, the order and even the jumpers available differ from
drive to drive, but my drive is pretty typical. Hopefully you
can find what each jumper on your drive does. On my particular
drive it's helpfully printed on the drive itself, but this is
uncommon.

Cumana in the UK marketed a version of it. You had a cartridge for the cartridge port, and it had a switch for either Atari 68000 mode or OS-9 mode. I got a copy of it with a used Mega 4 I purchased. I accidentally trashed two of the floppies before I realized what I had done. I was never able to locate replacements, so I eventually tossed it in the trash.

Definitely a multitasking system.

I agree. Having been reading this newsgroup for over 2 years, I don't ever remember anyone ever bothering to tell someone where the dang FAQ is! How does anyone ever expect a person read something when they don't know where it is?

I've always believed that no question is stupid when you don't know the answer. And to be made to feel stupid by having a question answered with something useless like "Read the FAQ (but I'm not going to tell you where it is)" is ill mannered and somewhat unfriendly, IMO. Not the reputation Atari users should want to be associated with.

Just my 2 cents.

book.

You'll find that an equally large number of people post to newsgroups without even reading them before hand, ask a question and request that you reply by email because they won't bother coming back to read the responses in the nesgroup.

Writing the FAQ was a lot a work. Now that it's done, it still needs maintaining now and then. I'm afraid I don't have any programming skills, so the Quick FAQ is my way of contributing to the Atari community. Most of the feedback I have received from this has been positive, with the odd bug report or broken URL, proving it to be a rather useful resource.

Besides, just because I answer posts with "the answer is in the Quick FAQ" doesn't mean that it's prohibited for you to give a more detailed answer.

> For this reason, I also hate when people answer everyone by telling them
to
> do a DejaNews search.

AFAIK, when I have a question about something specific, the first thing I do is check deja. In 10 minutes you can pretty well figure out if it's a FAQ thing or not, and usually get the answer too.

I would suggest getting the PARCP package, as this one is still maintained (I'm not sure about the currecnt status of Paralink) and they bothe require the PARCP cable, which is a modified parallel cable. The instructions on building the cable are included in the archive.

I'm probably going to get flamed for this, but the link to PARCP is in the Quick FAQ.

5696. AC Magazine - final clearance sale!

Newsgroup: comp.sys.atari.st
Date: 2000-05-10 00:00:00 UTC
From: mike@railwayman.idps.co.uk
Message-ID: <hreS4.942$J5.47806@stones>
Source record: 62205

OFFICIAL AC FINAL CLEARANCE SALE

We need the space for other stuff so we are completely clearing all remaining stocks of AC magazine, and are offering them for sale at just 1.00 UKP each including UK postage!!! (basically that's little more than the cost of P&P!). Matching Reader Disks for each issue are also available at 50p each, or get all the RD content on the Time.Capsule CD-ROM at just 1.00 UKP!

Surely the bargain of the year!

Atari Computing was the well respected A4 printed magazine which ran to 16 issues over a three-year period, finally closing at the end of last year. The magazines built up into a library of useful articles, reviews and tutorials and remain an important part of Atari history.

If you order five copies or more we will throw in the Time.Capsule CD-ROM free of charge, or you can buy it on its own at just 1.00 UKP. It features AC articles and software as well as three excellent music tracks performed by Mark Wherry.

AC issues still available are everything apart from 1-3, 5 & 8.

This offer will close on 1st June and all remaining stocks of the magazine and disks/CD-ROMS will go into incredibly deep storage!!!

For full ordering details, and to check availability of certain issues (some are almost sold out) please email me at the following address:

publish@welshnet.co.uk

Non UK orders are welcome although postage will have to be charged at cost.

All orders dealt with on a first come-first served basis, so please don't delay.

The sale really does have to end on the 1st June!

Mike Kerslake

>This was an early UNIX like operating system that was advertised in
>early ST mags.

kI would not call it UNIX like. The differences are far to big to call
it UNIX like. However, it does have a simmilar IO system call
interface.

OS-9 from Microware (this is the manufacturer) is an OS for embedded
systems. It is highly flexible and can be used on a wide variety of
systems. It can operate on diskless systems running completely from
inside the ROM, It does provide interfaces for easy and modular
writing of device drivers, adding system extensions (even new system
calls), adding hirarchys to the file system tree, managing resources
like IRQ vectors or memory,... You even can sybolically debug programs
from ROM, that means OS, debugger, target program and debugging
symbols all are in ROM, running out of the ROM.

Hehehe... especially since these days the Macintosh can read PC disks, and
the Atari ST is native to PC disks. ;)

Back then though, that was probably the best solution.

And your fear is real. I mention of course David Acklam who bought a Hades060. Had it shipped from a vendor in Canada (who is no longer in business sadly). It worked great for 4 months, then it died. He shipped it back to the vendor, who claimed he couldn't fix it, and then they had it shipped to Switzerland where it disappered along the way.

Hearing this tale has been the one thing that had made he consider an upgraded Falcon/TT over a newer Atari clone from over the pond.

Doctor Clu

PS: Lonnie, I thought you were working a deal with a Hades owner here in the states a while back?

(Speaking in Godfather voice)

Nicholas, Nicholas...

Whya you getting so worked up about the frequently asked question about the frequently asked question? They meana no harm.. they just don't like how people talk to the new people. You know Nicholas, the new people that come our way and say "I've gotta an Atari worry, can you help me?"
And then people tell them to "Get the FAQ outta my face" and that makes your Godfather so very sad. You see these tears, oh it's so sad. Tony... do something to make me happy again.

"Sure, we make you happy." (says a man from behind the Godfather who has a body of a large oak and arms like a fire hydrant who loads a gun before leaving the room)

Therea nothing wrong with the frequently asked question, but you see, while the family knowledge is there, we still need to look out for each other. We are a small family after all, right?

See, you are smiling. This is good. Real good.

I've never told anyone to sod off and read the FAQ. Pointing someone to a FAQ is just as friendly as telling him step by step how to solve his problem. It's just more convenient and usually more comprehensive.

The FAQ will usually give all the details whereas if you answer directly you'll probably get a whole thread with "Yes, but that's only correct if you're using TOS 1.02".

> "Sure, we make you happy." (says a man from behind the Godfather who has a

Did I ever say the contrary? I truly beleive that the Atari community is a small one and we have to stick together. It's also a very helpful one, and that's our biggest strength.

>
> See, you are smiling. This is good. Real good.

The FAQ and the newsgroup are not mutually exclusive. I direct people (usually newbies) to the FAQ, but you'll find that the FAQ also points to csas if you have any questions that are not in the FAQ.

I'm really baffled here as to what this outcry is all about.

>
> The SCSI tester prg with ICD Pro shows that there is a cd-rom there
> on lun 0 id 7 but we cannot read any cd-roms in the drive -- the
> drive shows as there but we cannot access it !!

Thats meaningless to some point as it get the information differently than
ICD Boot itself does.

>
> Any thoughts? It's a NEC 502
>
Well here goes my two penneth

> AUTO folder contents
> --------------------
> Auto folder is C:\AUTO
>
> ---Program--- --Size-- ---Date--- --Time--
> FOLDR200.PRG 820 1989/12/29 18:46:08

The above isn't needed as ICD has its own Folder fix, you would be safe to
delete it or at least disable it.

> JAR30.PRG 856 1992/12/08 13:09:32
> POOLFX92.PRG 1815 1997/10/13 15:24:00
> TOS14FX2.PRG 689 1989/08/04 06:29:26
> AUTOFMC.PRX 13442 1987/04/22 00:01:10
> ACC.PRG 768 1987/04/22 01:29:42
> CLOCKPCH.PRX 5220 2017/02/23 15:56:28

Appart from Jarxxx I don't know about the above

> DRVIN.PRG 3923 1998/02/17 09:51:06
> MFP.PRG 5223 1996/04/08 20:24:30
> STING.PRG 19488 1998/03/04 22:13:44

Its possable the above could be the cause of the problem as the order of
them caused me know end of problems, to find out if its them disable them,
and see if the CD Rom works, if it does try putting them last in order of
boot up, I think thats the way I had them.

> UIS_III.PRG 34632 1991/10/13 00:07:00
> WARP9_ST.PRG 64736 1992/12/13 15:35:36
> TOS2GEM.PRX 12046 1996/09/13 21:12:10
> EXTENDOS.PRG 10862 1980/00/00 04:16:40

I think I had Extendos running before Warp 9.

I can't get to my ST now as its up in storage in the loft to check my booot order.

Hope it helps

Hi all,

This is probably a newbie question and I've tried seriously to find the FAQ, but could not find it.

I can copy atari-files from an Atari-floppy to my pc thanks to gemxplor.exe. But how can i copy files from my pc to my Atari 1040 ST?

I have Cubase running on my Atari and a keyboard attached to it. Now i want to play some midifiles i downloaded from the internet to my win 98 pc on my keyboard, but the pc won't write on Atari formatted floppies and the atari won't read pc-floppies. Any suggestions?

Thanx.

Gerhard Stavenuiter

5710. Re: Read the FAQ? FAQ off!

Source record: 62219

Hi

My pennath worth coming up:)

I don't know what all the fuss is about. FAQ's are a essential part of computing. People who write these docs/publication take a hell of a lot of time to do so, hence the letter Q (for quick).

I know Nic and other authors do their best to keep things upto date, and this also takes time and effort.

Very rarely have I seen anyone pointed to 'go read the FAQ' unless it's a question that has been answered in DETAIL 3-4 times that week. We ALL were beginners once, and questions are the root to knowledge.

I've probably been guilty of suggesting someone to read something and not giving the address more than anyone else in this newsgroup.

But FAQ's aren't for the sole use of beginners, newbies or wannabies, there is usually information within them for ALL stages of expertise. Just because someone walks a differant way doesn't mean we all walk that way.

I think IRC would be a prime example of how well refering to an FAQ works. Can you imaging having to go through the same answers via a newsgroup, or even publishing the FAQ in a newsgroup; especially those that pay for their time on-line! If someone wants the address of the IRC FAQ, it's on the Demon FTP site: ftp.demon.net/pub/doc/irc I think or it may be on their ftp.demon.co.uk site.

I hope we aren't going to see a new wave of posts slagging off people who HELP keep this platform going, and try and make things a little easier for us all.

AFAIK the Atari ST can read DOS-formatted floppies. The 1040 has a double density floppy drive though, it doesn't read or write HD floppies. Try to get hold of some DD floppies and format them on your PC. The Atari should be able to read this.

Greetings, Freek Munniksma.

Maybe to make the ST popular again all it's programs shareware or
otherwise should be made Open Source?

btw - if anyone wants a copy of Martin Brownlows excellent Chaos
remake then mail me below and I'll send the url to you.

Now there's a refreshing post! ;-)

The Atari ST Quick FAQ can be found at http://bales.online.fr/atari

> I can copy atari-files from an Atari-floppy to my pc thanks to gemxplor.exe.
> But how can i copy files from my pc to my Atari 1040 ST?

Normally all STs can read DOS formatted 720K disks.

> I have Cubase running on my Atari and a keyboard attached to it. Now i want

You must format the floppies on the PC as 720K double density.

5715. Protext date problem

Newsgroup: comp.sys.atari.st
Date: 2000-05-10 00:00:00 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <8fcj3h$68m$1@freenet9.carleton.ca>
Source record: 62224

Re Protext date problem:

I'm using version 6.61. In the EDIT mode, ALT-D gives me the current date already set on my system clock. In the COMMAND mode, DATE gives me the current date but ALT-D adds one day to the date.

When I switched between the two modes a couple of times, I get the current date plus one in both modes, but the year dropped to 1998. When I closed out Protext, I found the system clock had been advanced to 2002.

Very strange. I don't now enough about the internal workings of the program to explain what happened but I'm sure it isn't very complicated.

Sorry, not trying to put Nic down or the Quickfaq.

WHy not when someone asks a question that has been answered before, guide to the corresponding page in the faq??

I think many newbies must get frustrated when they get told to look at the FAQ, it's like being told to RTFM.

That's news to me, hehe. I tried to get a medusa040 from some
guy who posted here but after a few months with no answers and
when he did finally answer he was "not sure" about certain
aspects. At that point I gave up on that one, I could be completey
wrong about the guy, but the risk ($600) was to big.

I do know of someone who mailed his hades to the same place
and got it back right quick and working again and he was
real happy. But yes I'm still quite afraid to take the risk.

I don't think the initial reply was meant to be harsh, only to
help. I myself have never read the FAQ since I've been using
this stuff for so long. So I could not even begin to tell you
what page to look on.

Normally I would not even reply... it's my assumption that
someone else will. :-) Beat me up for not caring...
but I think also one can spend to much time answering the same
questions over and over like others have pointed out.

My problem is there is no US dealer for it. So ordering
it seems risky. If I put to much thought into it I start
to think that it will only cause CAB to fail quicker. ;-)
For the time being I stick with my TT and not risk such
an order.

I have a voucher that came with a 1040ST when it was purchased. The voucher was for BOS/5 Operating System. The OS came in two versions

Diskette-based system(1 diskette) $11.95
Hard disk-based system(3 diskettes) $21.95

The OS was put out by:

BOS National, Inc.(United States)
BOS Software,Ltd.(United Kingdom)

The voucher list a few products that were available for BOS.

Did anyone ever get this OS and if so what was it like. Is it available anywhere for download or purchase.

Because what they have asked is a Frequently Asked Question (FAQ,
geddit?) which has been covered a zillion times before, so it's now in
the FAQ to save boring everyone to tears with it again.

> Not very useful

On the contrary: very useful indeed. FAQs are a record of the collective
wisdom of a newsgroup: read and learn.

>
> I agree. Having been reading this newsgroup for over 2
> years, I don't ever remember anyone ever bothering to tell
> someone where the dang FAQ is!

1) I'll give you a hint:

If you have questions about the TT, the answer is in the FAQ.

2) Where is the FAQ?

Pay attention to every detail of this reply and read every bit.

3) One more hint:

Their FAQ's address is always in the same part of the message,
for almost everyone who regularly posts to this newsgroup and got
around writing a FAQ about something.

> I've always believed that no question is stupid when you
> don't know the answer. And to be made to feel stupid by
> having a question answered with something useless like "Read
> the FAQ is ill mannered and somewhat unfriendly, IMO.

4) Ask yourself, why do people take the time to write a FAQ?

Because the same innocent, candid beginers' questions keep on
poping up again and again.

Now, if we kept on providing the exact same long answers here on
the newsgroup, instead of pointing people to the ultimate FAQ on
a given subject, we would be:

a) repeating ourselves.
b) poluting the newsgroup with SPAM

Instead, we collect our knowledge of a subject (in my case, the
TT030) and publish a FAQ on the web.

Then, to advertise it, we include the URL in our email signature.

5) At that point, we assume people to be mature enough to
read through our replies and read the URL in our signature.

Question #1

Got video output of any kind?
What modifications have been done to it?
Did it just die?

Mike

Yea, Deja sucks when you want to know something specific, but the
Atari FAQ is pretty simple, and answers a lot of commonly asked
questions. I hate to type the same answer over and over again, and
thank Nick for supporting the Atari FAQ. If the question is something
that deserves detailed information, people here usually provide
details in their post.
I also hate to have to send out the Supra Disk utilites several times
a month:)

What's wrong with pointing people to the FAQ ? Do you volunteer to answer
all the frequent questions over and over again with the same answers.

Once you've replied 5 times a week on how to attach a hard drive to an ST,
you might reconsider your opinion.

Please explain why it is not useful. If this is the general opinion, I might
as well just take it down and forget the whole thing.

Each time I point someone to the FAQ, I add my sig which contains - oh surprise - yes, you've found the holy grall, the URL to the Quick FAQ. Not that difficult to figure out, is it?

>
> I've always believed that no question is stupid when you don't know the

> where it is)" is ill mannered and somewhat unfriendly, IMO.

Show me one single post in csas where I omitted to include my sig with the URL to the Quick FAQ.

> Not the
> reputation Atari users should want to be associated with.

Again, do you volunteer to answer in detail every single frequently asked question that comes up. You'll be bored in less than a week, I can assure you.

I always thought that it was a kind of service to the community to put work into a central ressource that contains most of what you need to know about Atari computers. Apparently not.

I have fond memories of my ST life too, but one thing that kept annoying me on the ST and where the PC/Unix world had its advantages was that everyone who programmed for the ST seemed to want to sell his/her programs as shareware, no matter how basic the functionality was. It wasn't until the early 90's that Freeware became more popular (even for big projects). Even today there are some essential programs for the ST you'll have to dish out a lot of money for, whereas in the "Free Software" world someone would have duplicated the functionality to some degree and released it as Open Source.

Notable exceptions to the rule were the excellent shareware games by people such as Martin Brownlow, the Everest editor and a few other projects that were really worth their money.

Source record: 62344

Being bored one day I decided to connect my STe up to my PC using a null modem.
I installed the program "GhostLink" and got it working OK, but as it's a serial connection, it's very slow.
I've seen links on some Atari sites to a program called "ParaLink 2000", but all the links I've tried are broken.
Anyone know where I could get this program from?
I just want to play around with it and check out the transfer speeds of the parallel port.

5740. For John L Masterman

Sorry if this is slightly "off topic".

A few days ago I received an e-mail from John L Masterman. The subject was "Atari", so I assume it was from someone in this group.

When I try to read it, a warning message comes up saying that it is unsafe to do so. Trying to ignore this message to read the e-mail anyway, causes the computer to freeze and necessitating a reboot.

I have not been able to read this e-mail and have given up trying to read it. That is why Mr Masterman hasn't received a reply from me - assuming the e-mail required a reply.

>won't read pc-floppies. Any suggestions?

First the floppy has to be MS DOS formatted, do this by formatting it on
your PC, and remember you have to format as 720K not 1.44MB

The problem with Win 95/98/NT is that they uses long filenames which the ST
can't handle, this is because it uses an extra portion of the File
Allocation Table (FAT) called VFAT to store them. When the ST reads the disk
it does not expect this area of the FAT to be used and therefore displays
the Disk damaged/Drive not connected alert box.

AFAIK there are only two ways around this, the first it to have e-mail on
both computers (with different addresses) and send the files between them as
e-mail attachments, the second is to upgrade the OS to MagiC 6 which does
handle long filenames and therefore the Win 95/98/NT VFAT enteries, IIRC you
can run it on 521K ST so you should be ok with a 1040 though to get teh best
from it a ram upgrade is required if you want to run a 1 meg application
under MagiC, and you will need a hard drive unless you want to keep loading
it from the floppies everytime you need it.

You should be able to get a copy of Magic 6 from System-Solutions at
http://www.system-solutions.co.uk

You are a brave man! Why not look for a ready made expansion board such as Frontier?

I have done this job myself but I'm afraid I forget the souce of the instructions. It will keep you busy for days (maybe even weeks) on end. It relies on doctoring some larger chip sockets to fit the PCB tracks of the ST. You will end up with more than 512 hand-soldered joints and a large number of hand-wires. When I thought I had finished the job I had 3 'drys' left which took an absolute age to diagnose.

Bonne chance :-))

Well, Alex installed my Nemesis for me. And I actually went up to his shop in person (it was about a 6 hour drive for me). Anyway, he did a great job, checking all his work each step of the way. And he offered to fix any problems that might have occured down the line that were caused by his installation - although no guarantee of any kind was offered on the Nemesis itself, since I bought it used from a third party.

It's too bad that apparently my experiences with him weren't the same as others here.

I'm not sure if I have the name right, but there used to be a utility program that worked with PageStream (and possibly other programs as well?) that sped up printing a great deal. From my understanding, it really only worked if you were printing multiple copies of the same page (in PageStream for example), as it kept the page in memory so PageStream didn't have to "recreate" it each time it printed.

Lately I've been using PageStream quite a bit, printing out multiple copies of the CD jewel case inserts for my [original music] CDs, and the long delay before it actually prints is becoming far too annoying!

I don't see the program on either Systems For Tomorrow's or Chro_Magic's web sites unfortunately (yes, I'm in the USA). So, does anyone here know where I can get it, or whether it is perhaps freeware or shareware these days?

Thanks,

-Paul

Due to pressure of work & pocket (skint) I have for sale my Falcon. 14 meg tos 4.04. Comes with Tower case, that is the falc is not built in to it, The tower is separate with a 540 meg HD/4x CD rom/ 44 meg syquest drive with carts, connect to Falc via scsi port lead included. has all the goodies ie Magic 5 nvdi 4.xxx hd driver 7 papyrus plus lots of software.
I would like it to go to a good home ie Tari enthusiast, More bothered about that than the price.
I live in Sheffield collection or delivery nearby prefered but I spose carradge could be sorted.
More details on request.
Pete

Hi Nicholas,

Just for your information, I spent a few hours this morning trying to set
up the latest version of Sting an the only problems I had were when I tried
to scroll through the FAQ - CAB totally locked up every time :-(
Back to the earlier version (no problems with it).

I would also like to add my thanks for the work you have put in on the
FAQ - a grand job.

How much would you be willing to let it go for? I have a freind in
Manchester who had got about 7 Atari's and never owned a Falcon.

Simon

They are very rare, a Atari Transputer Workstation.
I almost got one last year, at a prive of 100 bp. it was a steal. but
someone got it before me.

cheers

Oh yes they was available to the public.

At least here in Denmark, but at a price of 70,000.00 dkr. only
Copenhagen University got one, mainly because the chairman of the old
Danish Atari Club - ST/Op, was a professor at the Uni.

cheers

The Medusa is a good machine it is a basically a TT030 on steriods.
It also has the full DMA and VME as the TT030. It is no longer in
production. Only the Hades exist like the Medusa but minus the DMA.
$600 is a very good deal.

You might talks to a Hades owner who uses machine to type articles
for Current Notes. He had his machine worked on and had no problem
getting it back. He also still uses his Hades for digital
photography. David Barkin d.barkin1@genie.com

It was series of printer drivers done by Straight Edge Software. In
Canada, I believe. He also wrote drivers for Calamus. I have a copy,
but not handy, and danged if I can remember the authors name.

Good Grief, Charlie Brown, look what we've stirred up! <G>

Gentlemen, I do not mean to start any kind of a flame war here, I'm just going to offer some suggestions I believe will only help in finding and using the FAQ's. Which, until Martin's post, of which some follows, I did not know where to find.

Martin-ï¿½ric Racine wrote:

> 3) One more hint:
>
> Their FAQ's address is always in the same part of the message,
> for almost everyone who regularly posts to this newsgroup and got
> around writing a FAQ about something.

This is the first time I've heard about this. I rarely read signature files for information. I figure the information to be gleaned from a post is in the body of the message, not found in the signature.

> Martin-ï¿½ric Racine http://funkyware.atari.org/ Atari TT030 FAQ
> Lappeenranta, Finland. Surfing on a Intel/Microsoft-free GEM OS

Take a look at your signature file. Nicholas' signature file is similar. Yes, there is a URL listed, and the Atari TT030 FAQ, but please note that the signature file does not state that the FAQ listed is at the URL site. There is also no indication that you are responsible for creating the FAQ. You are assuming that the reader will a) read your signature file, b) know that you created the FAQ, and c) automatically know the FAQ is at the website.

IMO, that is a bad assumption. It seems to me you've forgotten to factor in the probability that the person doing the asking is basically a beginner, and that beginners need more help than the experienced person. They are not likely to have the experience necessary to make the connection necessary in your signature file. I've been reading this newsgroup for 2 years and never made the connection. And my first Atari was the first 800 model! <G>

> 4) Ask yourself, why do people take the time to write a FAQ?

> Instead, we collect our knowledge of a subject (in my case, the
> TT030) and publish a FAQ on the web.
>
> Then, to advertise it, we include the URL in our email signature.

And now, for the first time, I know where these FAQ's came from. <G>
And everyone who created them should be commended. I did something
similar years ago on the old Genie online service with a long post about
GDOS. It's probably still in their libraries.

For those that are going to reply to a question by directing the
questioner to go to the FAQ's that person replying have a macro ready
that goes something like this: "You'll find the answer in the FAQ's
located at http://www.xxxxxxx.com" or something similar. If I had seen
that answer or similar a long time ago, I would not have been getting
irritated about being directed somewhere and not knowing where that
"somewhere" was. <G>

> 5) At that point, we assume people to be mature enough to
> read through our replies and read the URL in our signature.

I learned a long time ago never to assume something. It has usually
gotten me into more trouble than I cared to deal with.

For those who who created these FAQ's it is an excellent idea. And just
the type of help the Atari community has been known to provide.

I do have to take issue with those who are unhappy with answering the
same questions over and over again. Having the same questions come up
again and again indicates a user new to that area of the Atari and
computing in general. And new users are necessary to expand any
product. But, as we all know, the Atari market is continually
shrinking, there are not enough new users, and we know there is no
advances on the hardware end. (Hades and Milans do not count, there's
no major advances in the basic OS abilities AFAIK.) No new users
equates to no new software, right?

I've learned that when it comes to telling someone how to do something,
never assume they know a particular fact, nor that they will come to the
same conclusions that you do. All people think and see things a little
differently, so I've learned that the best policy is to be as specific
as possible in order to prevent misunderstandings and frustrations.

::Very big grin here:: And now I can say I know where to find the
FAQ's, and who produced them. And had it not been for me and one other
person having "problems" (:even bigger grin: Hi, Mr. Macdonald!) and
starting all of this discussion, I'd still now know the wherewithall of
the FAQ's! <VBG>

From: bensmith@user2.teleport.com
Message-ID: <8fg8m8$rf0$1@user2.teleport.com>
Source record: 62176

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

By definition, a FAQ follows a structure of Question/Answer, is
numbered, and is ordered by subject. Looking at the table of
contents should provide the answer, and it usually does.

> I think many newbies must get frustrated when they get told

Which is actually a very good thing. None of us FAQ authors
learned all we know through divine intervention. We just
bothered reading the manuals. More than once, in most cases.

5774. RAM upgrade for 1040 STf

Newsgroup: comp.sys.atari.st
Date: 2000-05-11 00:00:00 UTC
From: rodent <rodent@epix.net>
Message-ID: <391A2021.39A2F017@epix.net>
Source record: 62239
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Does anybody know where I can find schematics to upgrade the RAM in a
1040 STf to 4MB?

Great! Good to know theres still stuff going on...

I've been looking around and around and around for
all the OS's for the 68000 atari's, you could say
I'm collecting them, so I'll check this one out.

thanks

chris.

Woller is perhaps the worst of them all, e.g. it took him about a year to send me something I didn't order at all, but had to accept because he couldn't get hold of the Multiboard he'd sold me and refused to refund my money.

When you arrive at the Quick FAQ, the first thing to come up is the table of
contents. It is also all in HTML, so it will only take a couple of seconds
to find the exact section of the FAQ.

It's the infamous Atari Transputer. These were parallel processing machines using a Mega ST as the I/O interface (screen, keyboard, floppy, etc...). The idea was to stack up several of these machines to get one big super computer. From what I understand, there's not much point in having only one of them.

There was only a very limited quantiy built, apparently mainly sold to universities. I seem to remember that Kodak also bought a bunch of these for the development of the Photo CD format. It was never made available to Joe Public.

OK, TOS is multi-lingual. What about MilanAES and MagicMilan?
As for the keyboard, generic does not necessarily equal
US/English. What does <Shift-3> map to, the "#" sign or the
British pound sign? What is to the right of the semicolon? (In
the U.S. it's ' or " depending on shift key status.)

That's correct, that's why you need a decoder-card.

> of thing, an additinal decoder will have to be added to the Milan. If for
> example a ATI card comes with a DVD driver and licence, it means that ATI
> has payed for it. Writing a driver for the Milan, doesn't have anything to

> doesn't have to pay twice for a licence?

That depends. I'm not sure if the encryption-keys - which is what you pay
for - is in the hardware or the software-driver. Correct me if I'm wrong
anyone, but I believe it's in software. And it that case you have to get a
new licence.

And *if* the keys are in the hardware, why do you think the manufacturer
would hand out specs on it? Why do you think that there's no free drivers
for e.g. Creative or ATI-decoders for Linux?

>>Again, this is an economical issue. Hardware-vendors doesn't hand out
>>the necessary specs just like that (well, most don't).

Exactly! And to write drivers you need - you guessed it - specs on the
hardware. And in many cases this costs money.

>>Thank God for free/shareware, compilers and opensource ;-)
> When are they going to support the new machines for a change ?

Let's see, which OS was the first to support the Milan? Which VDI supports
ATI Rage PCI-cards on machines with PCI-BIOS? What OS supports
ethernet-cards?

M.AES can be changed to Enlish by editing the MAES.CNF file

> As for the keyboard, generic does not necessarily equal

What Shuiming meant was generic port, that is you can buy a keyboard in your
language and use it.

Does anybody know what kind of hardware you need to use ADSL? It's been
available for about a year here in Norway, but it's still *very*
expensive.

> latest standards to the maximum. Oh, and that from MagiC 5.20 onwards

> programmers, only program for themselves....

It's very, very simple: To port DHCP to MiNT-net (DHCP isn't a part of
TCP/IP, it's a separate service.) you simply need...

a) ...the sources for DHCP for Linux/NetBSD/etc.
b) ...suitable hardware *and* somewhere to test it.

Currently I only know two persons that has both hardware and access to a
DHCP-server, neither has the skills to port DHCP.

If you can get ahold of a Power Macintosh that supports 16-color mode (4 bits per pixel) you can install this:

ftp://ftp.machack.com/Hacks98/asciimac.sit

"Filters all display output and turns it into ASCII art in real time, in honor of the disturbing resemblance between the iMac and old VT100 terminals. Best Hack and winner of the coveted Victor A-Trap trophy! These MacHack newcomers from MIT wowed the crowd."

Such a Mac is a rare beast, most of them bottom out at 8-bits per pixel. I personally haven't seen this hack in action. But it sounds really cool.

I maybe that way for a long time. I do not beleive the Milan II will
be in the USA until sales in Germany and the UK are high enough
profit that the risk of sending units to the USA.

Bsides most of the parts for your Ford and Jeeps are now sourced
outside of the USA. So I do not see the difference. All you need to
fix your Hades is a good electronics technician to read the schmatics.

The Hades is the oldest of the Atari clones (1994) and has the most support.
The Hades is the second generation machine the earlier model was the
Medusa (1992).

::::}The "text-GUI" in your sig, is it really used somewhere,
::::}or is it just an ASCII graphic phantasy?

Pure fantasy, as you put it...

But it wouldn't be too hard to actually implement, even
easier to do on a none intel (i.e VGA/CGA) box, that is
it would look better, in the text mode of other computer
types (esp. Amiga...Woops).

I bashed it up one day when I was bored, but I had been
meaning to it for a while.

I really get into computing platforms other than PC (and
I'm not alone, I know..), I like to collect OS's for each
machine I have, and I suppose I even dream about ones that
dont exist yet (i.e my sig?).

The release of Minix 1.5 for 68000 machines is great, I've
been pulling down everything I can get of that recently.
Do you know of any other OS's (must be free implementations
though) available for the Atari (68000 only, I know...but I
dont have a falcon or a Mega 4 yet)?

chris.

Hi Marinos,
I go back to '87 with my Mega ST4 (which still functions well, keyboards
a bit sticky, after uncountable number of hours on it) and if I recollect
right programs for the ST were cheaper than their counterparts on the PC
because Atari owners refused to be ripped off for programing after paying a
higher price for the hardware (getting more hardware for the money though
and factory installed). I believe that was a problem with Word Perfect!
And "shareware" does'nt mean they got paid! Freeware is nice but getting
paid is nicer! Just my thoughts.

From: Martin-ï¿½ric Racine <q-funk@funkyware.atari.org>
Date: Tue, 9 May 2000 17:53:43 +0300

Hi Martin-ï¿½ric,

>In MiNT's case, the current trend is to provide a rock-solid,
>fast OS with all the networking goodies one needs, which usually
>means CLI freeware tools.
I never said that MiNT itself isn't rock-solid. It is just as solid as
the latest MagiC. However N.AES is not solid, and it's quite easy to
take it down... how good is the combination of a rock-steady kernel and
a not very stable AES shell?

All the network goodies I need?
The only reason I need a network is to make a connection to the cable
that runs here. I have the network card and the cable modem but can't
use it simply because the cable company doesn't give fixed IP numbers.
One has to use a dynamic IP number, AFAIK this is not supported by
MinTNet.
The next hot thing around the corner is ADSL, it's not as fast as the
cable, but compared to what we have now.... the ADSL providers don't
give fixed IP's either, except for one exception, but that costs a
fortune each month.
So, simply put... MiNT-Net doesn't work for me, since I can't use it
for networking, where's the incentive to use it? except for ICQ which
I don't care for, all clients are available for MagiC, and these are
just as good, in many respects even better <grin>. Why should I install
an OS that "eats" memory to do exactly the same things as I do now? Why
do I have to give up using clients that are programmed to take the full
advantage of the OS, that work together extremely well, and use the
latest standards to the maximum. Oh, and that from MagiC 5.20 onwards
with PPP 1.8 installed don't slow down either when used in conjunction.
Well, I'm prepared to give it all up just for the sake of having that
high speed connection... but since DHCP on Mint-Net doesn't work for me
I'll stay a MagiC power user for a while longer ;-)

Which brings us back to where we started: the lack of support... some
people will be lucky enough to have a provider that give fixed IP's,
and are actually online now using MiNT-Net with a high speed connection.

What about the rest of us, in Europe the trend is towards dynamic IP
numbers... Someone buying a Milan adding a network card and installing
MinTNet, will get a nasty shock.... one doesn't go to all this trouble
just to use it with a modem.

There are rumours that the next version of MagiC will be capable of adressing networks also.... logical of course, the standard Milan OS must be capable of at least addressing a network card. I'm convinced that connecting to a cablemodem using the DCHP protocol with or without fixed IP will be possible.... is it really that difficult to implement an option to support dynamic IP numbers? or was I right and do the Mint programmers, only program for themselves....

One of the things that you and others overlook is that MinT-Net has a headstart, ASH is slowly bridging the gap, every client released is just as good as his counterparts, and in combination with ASH Scripter very powerfull, the day will come that the gap is bridged....

Cheers from Belgium
Dennis

From: Jo Even Skarstein <joska@nvg.ntnu.no>
Date: 7 May 2000 13:20:58 GMT

Hi Jo Even,

>>That DVD player shouldn't be to difficult *if* someone writes the
>>drivers for the appropriate additional plugin card. Forget about
>>watching films

>That's not a technical issue, but an economical. DVD-licences are *very*
>expensive.
It *is* a technical issue, the 68060 hasn't got the raw power for this kind of thing, an additinal decoder will have to be added to the Milan. If for example a ATI card comes with a DVD driver and licence, it means that ATI has payed for it. Writing a driver for the Milan, doesn't have anything to do with that licence, it's been payed by the card manufacturer, one surely doesn't have to pay twice for a licence?

>>are avaible now (CD Writer, Scanner, NVDI) don't really come cheap, I'm
>>convinced that the USB drivers will cost us once again an arm and a leg.
>
>Again, this is an economical issue. Hardware-vendors doesn't hand out
>the necessary specs just like that (well, most don't).
This is not something the customer has to worry about. I've got a cupboard full of drivers, every bit of hardware that I bought over the years comes with these, even a stupid mouse come with drivers. My point is that the cost of these drivers will have to be added to the Milan2, if they ever get written that is..

>>Aniplayer and Falcamp play MP3's.
>>On a Falcon you can play these, yes.... what about creating them?
>
>No problem, several converters has been available for a long time. You
>have to type though ;-)
I *know* it can be done since a long time, I ment creating them in real time... not the way it's done now, having to wait until kingdom comes, regardless of typing in commands. I suppose adding a decent GUI to the program would slow it down even more?

The point is that when the Milan2 arrives, people will be wanting to do the same things as on the PC and Mac, and the software simply doesn't exist to allow this. Even our existing software doesn't really work: IIRC only the driver for Epson scanners work correctly with the Milan, these scanners are not really cheap and then one has to buy the additional SCSI card also, which doesn't come cheap either.
Then there's the problem with CD Writers... I haven't really heard of one

person yet that has been burning CD's succesfully on the Milan, the drivers don't come cheap and don't support the popular writers anymore...
Except for a press release from Milan itself, telling us that HP would support the machine and supply printerdrivers for it, nothing is heard from that anymore, Milan has announced vapourware before and I don't like the HP printers to start with...
Installing a network card, requires to install a different OS, regardless if the user likes this OS or not, in another posting I wrote about the problems getting connected to the cable or ADSL because the drivers are not up to today standards...
etc.... I could go on all night long, there's a long list that isn't working or supported properly on the Milan, and it has been released two years ago.

The market trend is towards USB, hardware with SCSI interface will become scarcer and more expensive, because it will mainly be geared towards the professional market. The beauty of our current systems is that we can add nearly every SCSI device available. There's really not a lot around that can't be connected. With USB this is going to change...
Considering all this, one really should think very carefully before buying the Milan2, if it's not going to be supported in a proper way, the user wil be stuck with a nice but in many cases useless machine, having to use his "old" machine for certain tasks.

>Thank God for free/shareware, compilers and opensource ;-)
When are they going to support the new machines for a change ?

Cheers from Belgium
Dennis

Hi Galen,

>>Supposing something breaks down that you can't repair yourself,
>>the whole lot has to be shipped back to Germany....

>This is a real problem. I need the thing to have a U.S. (or at
>least English) keyboard and desktop or my wife will complain
Replacing the keyboard with a US version is no problem,

>To be honest, shipping something back to Germany
>isn't a problem, provided I can talk to them. If that Atari
>dealer speaks English, it wouldn't really be that different from
>ordering from Great Britain, which I've done several times.
The language barrier is a universal problem. Every dealer in the world wil understand perfectly what you want when you want to buy.... it's when you have problems that they suddenly only speak one single language. My German is quite good, and still some dealers pretend not to understand me when there's a problem...
In Germany just like in the rest of the world, you've got good and not so good dealers, and among them are people which in my book are crooks. The trick is finding a dealer you like and can trust, I've found one, but then I've heard horror stories about that dealer from other people..

>Partially, I'm just stubborn. Secondly, my PC is at work, not
>at my house (a PC Free Zone). MagicMac is darn intriguing
>though, and Magic is mature enough to be relatively decent. If
>no Milan II comes, that'll probably be my choice.
We all are stubborn, otherwise we wouldn't be using Atari... MagiCMac is a very good emulator, but it's not a real machine of course. Emulating a Atari is not the same as using the real thing... but that's another topic.

Cheers from Belgium

```
Did you replace every file from the old archive? There are incompatibilities
between old files and new files, so you have to use all the new files from
the latest package.

CAB locking up usually means a problem with CAB or with the CAB.OVL. Did you
get the latest OVL from Olivier Booklage or Dan Ackerman?

All MagiC versions I have tried are easier to crash than TOS
ever was.

> since DHCP on Mint-Net doesn't work for me I'll stay a MagiC

So, where is the Ethernet and DHCP support in I-Connect? None!

Meanwhile, this TT is connected to the univeristy's ATM line
using a fully supported Riebl card on MiNT-Net.

Source record: 62190

I just got a used Moniterm Viking monitor for my TT and just discovered that I cannot connect it directly to the TT VGA monitor port as the connector on the monitor is a male DB-9. I since learned that I need to make an "ECL Adaptor", and I found the pinouts for this on the web, but I want to make sure the wiring is correct.

Is somebody else using this monitor on their TT, and if so, please give me the pinouts for making the adaptor. I'm not sure that other similar monitors are wired the same. Thanks.

<Amiga2000@bigpond.com> wrote in message
news:391b5f3e@naylor.cs.rmit.edu.au...

: The release of Minix 1.5 for 68000 machines is great,
: I've been pulling down everything I can get of that
: recently. Do you know of any other OS's (must be free
: implementations though) available for the Atari (68000
: only, I know...but I dont have a falcon or a Mega 4
: yet)?

You mean Minix the OS, not just the filesystem? It works
nicely on your ST? Tell us more! Btw, the sources are
here: http://www.cs.vu.nl/~ast/minix.html

I posted a short note on QNX recently, they'll be
releasing the sources to the public real soon now.
(Download here: http://get.qnx.com) No licence fees for
non-commercial users. With some work I suppose it could be
made to run on both Ataris and Amigas. Hardware specifics,
like video and port drivers etc, would have to be taken
care of separately for each platform. If you're curious
you can download a demo diskette image for the PC from
their site. I've tried it, it's quite impressive.

There was another Atari ST cartridge based OS from the UK
advertised in magazines, but it seems it never caught on.
It had flash EPROM:s and could be upgraded. Shame I can't
remember it's name, SMS? SME? SMG? Anyone?

Ben, will this do?

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

Message-ID: <8fisa2$sr6$1@nnrp1.deja.com>
Source record: 62117

Hello All:

A while ago I had registered for some web space on Netscape .com. I was going to put a midi file site there.But now decided to mirror my Atari Midi World site as sometimes I have problems with my providers server.

It is here:

http://sites.netscape.net/timconrardy/index.htm

Please update your bookmarks. Looks like I will be updating both sites as I get new material. Never ending project!

Also: The Fractal Music Composer Link to the Zip file
was not right all this time so I fixed that..Whew!!So NOW you can go get it.!!!

Any feedback on the site would be great.
If any of you "web masters" would like to design a better Opening Pic, I would be highly honored! I am really a beginner at HTML with a goal to create an Atari Midi site usable by all Atarians as well as people curious about Atari and Midi.

I would also invite any of you to join the Atari-Midi Mailing list. Dr T even joined us and we are having some great discussions.

Tim

>You must have a problem with shakey hardware or use dubious software.

I'am a MagiC user, MagiC is "solid" but it's easy to crash it.
When a file is opened and not closed, you delete this file, it's the crash !
An example:
You edit and print a file, with printmon you have a spooler who files
are created during printing.
With Newdesk you delete this files, it's strange but it's possible.
After printmon is closed, it's the big crash FATAL ERROR IN DOS-XFS.
All versions of MagiC has this problem.
It's not an hardware problem...it's a bug. Sorry.

Regards,

Didier.

I too am very happy with the Atari 1040 I use in my MIDI studio. I only wish that there was some device out there (perhaps there is and I don't know about it yet!) that gives MIDI ports B,C,and D MIDI In's too. I use the MIDI In of the 1040 and the 2 MIDI In's of Unitor 2, but EXPORT only has MIDI Out's. I use Notator/Creator SL. My new MIDI instruments are best connected to the MIDI In's and Out's of the interface in order to utilize their advanced features which can be recorded on the sequencer. Anyone know of any devices that can add more MIDI In's beyond what I have? Larry G.

Are you sure that ID7 isn't being used by something else, like a clock?
Try changing the CD's ID (and the relevant assignment in the BOS line of
EXTENDOS.CNF, of course).

Also, if you have IDE as well as SCSI buses, you may have to add 8 to
the ID number.

>won't read pc-floppies. Any suggestions?

The Atari *will* read PC-formatted floppies as long as these are DD and
not HD, formatted to 720 kB. There are also PD programs available that
write a PC-compatible boot sector to an Atari-formatted disk for the
early TOS version machines that didn't format according to IBM specs.

These include DISKMOD.TOS (with associated BLOCK0.DAT file which
contains the actual boot sector to be written), and also BLUEFORM.ACC +
BLUEBOOT.DAT (this does not keep any data already on the disk), or
IBMDRIVE.PRG + .RSC (which does, I believe, like DISKMOD) or the
PCFORMAT.PRG + .RSC disk formatter.

Regards, /Peter/

Yes, but his postings are long, and repetitive, and he doesn't even bother
to monitor the newsgroup. This is a breach of netiquette. Of course, this
can be tolerable for a while since Ben does support the Atari community, but
it is annoying to download the same long post every two days.

Hi kadu.flyer@zetnet.co.uk,

>>The SCSI tester prg with ICD Pro shows that there is a cd-rom there
>>on lun 0 id 7 but we cannot read any cd-roms in the drive -- the
>>drive shows as there but we cannot access it !!
>>
>>Any thoughts? It's a NEC 502

I'm sorry but I have missed this thread so don't know what your system or
setup is so this may not be at all relevant to you but I do have an NEC SCSI
CD ROM Drive controlled via a Link 97 host adapter running HDDriver 7.80
and ExtenDOS Gold 3.2b.
I have HDDriver set to skip ASCI 02.00 on boot so the CD is only controlled
via ExtenDOS.

HDDRUTIL 7.80 IDCHECK:

ACSI 00.00: QUANTUM FIREBALL_TM2110S300X Direct Access
ACSI 01.00: IBM DDRS-34560 S97B Direct Access
ACSI 02.00: NEC CD-ROM DRIVE:5002.8 CD-ROM/DVD
ACSI 05.00: IOMEGA ZIP 100 J.02 Direct Access

With my STfm/STE using ExtenDOS the system/host adapter takes up SCSI ID 7
although you can reconfigure this via one of the options. I also remember
reading somewhere that it was recommended to have CD drives on ASCI 05:00
although mine seems to work fine on 02:00.

Something I did come across lately after having a modifcation done to my
STe was that I had to activate via the global options "force use of
intermediate I/O buffer" to get previously readable CD ROMS to be
recognised. After changing this option to Yes everything has worked fine
ever since - touch wood.

Here in the US DSL carriers are advertising a DSL modem which you
connect to an ethernet card. Promoters are offering free modem and
installation for a one year service commitment, ranging from $40 to $65
per month.

The TEC printer engine was not used exclusively on Atari. Any good
supplier should be able to order them under the Atari or Laserpro names.

Hi Martin-ï¿½ric,

>So, where is the Ethernet and DHCP support in I-Connect? None!
Would you tell us the difference between not supported (yet) in IConnect
and not implemented in MinT-Net ?

>Meanwhile, this TT is connected to the univeristy's ATM line
>using a fully supported Riebl card on MiNT-Net.
Just because it works for you, you assume that it will work for the rest
of the world as well. It doesn't.... dynamic IP numbers really need to be
supported. Cable modem and ADSL are not wide spread yet, but this is going
to change quickly in the coming years... I might be the first one here who
has this specific problem, but in the coming months a lot of this kind of
postings will appear...

Real soon, MagiC users will be able to point these people to the OS that
supports DCHP with dynamic IP numbers, what are you gonna tell them ?

Cheers from Belgium
Dennis

Hi Jo Even

>Does anybody know what kind of hardware you need to use ADSL? It's been
>available for about a year here in Norway, but it's still *very*
>expensive.
A simple ethernet card and software that uses the DCHP protocol that can use
dynamic IP numbers... the phoneline has to be digital, and the phonecompany
installs some kind of splitter..

>>Writing a driver for the Milan, doesn't have anything to do with that
>>licence, it's been payed by the card manufacturer, one surely doesn't have
>>to pay twice for a licence?
>
>That depends. I'm not sure if the encryption-keys - which is what you pay

>new licence.
>
>And *if* the keys are in the hardware, why do you think the manufacturer
>would hand out specs on it? Why do you think that there's no free drivers
>for e.g. Creative or ATI-decoders for Linux?
I don't know about Creative but there is a *Linux decoder* from ATI, the VHA
(Video Hardware Accelerator) OpenGL and Xfree 4.0 drivers support video
hardware decoding under Linux for the Rage128 and Rage 128Pro chips, MPEG,
MPEG2 and DVD are supported.
see http://www.ati.com/na/pages/resource_centre/dev_rel/linux.html

Matrox has also announced OpenGL drivers for the G200 and G400 cards, the
others will (have to) follow..;-)

>It's very, very simple: To port DHCP to MiNT-net (DHCP isn't a part of
>TCP/IP, it's a separate service.) you simply need...
>
>a) ...the sources for DHCP for Linux/NetBSD/etc.
>b) ...suitable hardware *and* somewhere to test it.
>
>Currently I only know two persons that has both hardware and access to a
>DHCP-server, neither has the skills to port DHCP.
I know it's simple, you and others have repeated this endless times before,
but you also confirmed what I've been saying all along... this will only be
implemented when one of the MiNT programmers need it himself...and as long
as that doesn't happen the *ordinary* users can wait until kingdom comes.

>Let's see, which OS was the first to support the Milan? Which VDI supports
>ATI Rage PCI-cards on machines with PCI-BIOS? What OS supports
>ethernet-cards?
Are you asking me? :-)
-MinT came with a 68040 compiled and optimised kernel, calling *that* Milan support is a bit far stretched... oh, just for the record, the first OS to support the Milan was the Milan TOS ;-)
-fVDI supports the ATI Rage cards, but is still beta.... why would I use a beta driver? it's beta as long as I can remember, if I would have a Milan then I want optimised stable drivers for it... does fVDI qualify for this?
-MinT-Net supports ethernet cards, but that hasn't got anything to to with supporting the new machines.
Jo-Even, you haven't convinced me!! the three examples given were there long before the Milan, give us three examples that have been specificly written or ported for the Milan, while you're at it, what about that other machine? you know... the Hades.

>> One of the things that you and others overlook is that MinT-Net has a
>> headstart, ASH is slowly bridging the gap, every client released is
>> just as good as his counterparts, and in combination with ASH Scripter
>> very powerfull, the day will come that the gap is bridged....
>
>...at a price ofcourse. $$$$ and the loss of freedom. Count me out.
Yes, it will have to be payed, but facing the choice between paying for it and be able to go online, or not wanting to pay for it and having to wait until someone with the right *skills* comes along and port it to MinT-Net, well, then the choice is made rather quickly.... isn't it?

Cheers from Belgium

When i switch on the computer i get a grey screen then 57 secs later GEM comes into view, is this
normal, can i make GEM appear straight away?

How do i establish how much memory the computer has?, i think it has a memory expansion but not sure
what size.

Any idea where i can get the manual in text format?

Thanks in advance

David

Hiya

Yes you can. You will need to format a disk, or make sure a blank formatted
disk is inserted in the disk drive. Otherwise you'll have to put up with the
wait.

And while you're messing around with the disk, you can arrange the desktop
and screen resolution how you want them, and then save the desktop. Then
everything will be as you want it upon bootup:)

David all you need to do is this. Whilst gem is running format a
floppydisk and then leave it in the floppy drive while you reboot.
You will find gem starts right away.
Your memory config can be determined several ways. If you do need
to know how much memory you have fitted letme know.

5850. MacGorilla Website Covers Atari

Newsgroup: comp.sys.atari.st
Date: 2000-05-14 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-8FCF6C.12582414052000@bigmomma.idirect.com>
Source record: 62050

Hi guys,

well, I'm doing a bit of work now as an unofficial "Atari guru" for the website MacGorilla (http://www.macgorilla.com), providing them with info on some of the upcoming stuff for the Atari and Milan.

check it out, and if you have an announcement Atari-related, be sure to drop off a tip or press release at the email link.

as well as Atari, they also deal with Mac, Linux and Amiga news. It's an interesting site.

Yes: Use the standard configuration that comes with N.AES 2.0.

Also, buggy programs shouldn't crash the OS, if it does then it's a poorly
designed or implemented OS. But that's not a problem here, even with a
beta kernel I haven't had any problems with N.AES since I fixed that
horrible standard configuration.

>
>Not mine, sorry to disappoint you.

Magic 4,5,6 has this bug.
Another exemple, you receive X email with Newsie.
You start a text editor, and load a file received by newsie.
You save this file => error It's normal because Newsie hasn't closed it.
If you delete this file and close newsie you obtain the same problem:
FATAL ERROR IN DOS-XFS
Because newsie close all files when you quit it, and this file not exists !
It's not a bug in newsie, it's a bug in the system.
My english is bad, but I hope that you have understand now.

>>It's not an hardware problem...it's a bug.
>
>I dont have that problem here!.

Do you have tried to delete spool files created by printmon (before
the end of printing) ?

If the files are closed before than you delete this files
you cannot found this bug.

Regards,

Didier.

A 520 will have 512K as standard. If you want full details, use sysinfo
from:
http://bales.online.fr/atari/files

> Any idea where i can get the manual in text format?

It's useless. The most part of it is how to move a mouse and click on an
icon. You'd be better off reading the Quick FAQ.

From: Ken Kosut <kjcat@execpc.com>
Message-ID: <391f6352$0$29759@news.execpc.com>
Source record: 62057

Hello,

I am trying to reformat a 200MB removable SyQuest.

I am using HDX v5.03c
The drive begins to format for a while.
Then I get a "stop" message saying that it cannot format the
drive. Check the cable connections.

Well I checked and rechecked. Even cleaned the contacts with LPS.
It does the same thing.

Any suggestions would be appreciated.

Thanks

ken

5858. SpeedoGDOS and Logic 2.5

Newsgroup: comp.sys.atari.st
Date: 2000-05-14 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <391f6837$0$63041@news.execpc.com>
Source record: 62058

Hi,

Was wondering if SpeedoGDOS is compatabile with Logic 2.5

A font folder file selector comes up prompting for a font with
a .FNT extenstion.
Speedo fonts have a .SPD extension.
How would you access? The manual doesn't go into details.

The Logic 2.01 manual does show the use of fonts like Helvetica
and Chicago.
These fonts did not come with the program, so how are they accessing
them?

Thanks for any help.

ken

I had the same problem when I first started label printing (beofre my
first postscript laser) and my workaround was GemSpool, where I could
tell it to print hundreds of labels but only had to output it from
Pagestream once. With the ram cache set high enough as a buffer between
the disk spooled file and the printer port, the spooling was virtually
unnoticable if I wanted to keep working on designs while printing. The
only thing I'd notice was an occasional fractional pause on the keyboard
occasionally.

>Thanx.
>
>Gerhard Stavenuiter
>

To expand on the other answers a bit ... the Atari ST used the
MS-DOS floppy disk format, but due to an error in the TOS formatting
routines, the first few bytes were written incorrectly.

This means that while an ST will read and write to a disk (of the
proper capacity) formatted by a PC, the PC will not recognize a disk
formatted by the ST as being properly formatted.

There are programs, both for the ST and for the PC which will fix this
either during or after the disk is formatted, and later versions of
TOS (1.4 and beyond) supposedly fixed the internal format routines to
make the disks compatible.

For earlier TOS versions, the usual answer, and the most effective
usually is to simply format the disks on the PC. Then both systems
will be able to read and write the disks, and you can use the disks to
transfer files between the two.

Note that the ST can only read 720K "Double Density" disks.

Disks with this native capacity are difficult to find these days, but
you may have success if you format normal 1.44Meg High Density disks
on the PC after selecting "720 kb (3.5")" in the format dialogue box.
Be sure to also select "Full" for the "Format Type" to be sure the
entire disk is reformatted in 720Kb mode.

You might find that you have to cover the High Density index hole in
the disk to make the lower density format work properly. (Not likely
with Windows 95/98 format routines, but you used to have to do this
with earlier OSs.) If you have any problems formatting the disks,
cover the hole opposite the Write Protect hole with tape to fool the
drive into thinking it's a Double Density disk.

Label the disks as your "Atari transfer disks" and you should be able
to copy from the PC to the ST and back again.

This is a bug in TOS 1.06 (also called 1.60). It is only in
this version and is not in 1.062 (also called 1.62). It is
correctable with an autofolder program, but I no longer have it
around. Anyone else?

>Are there any cool utilities for changing the desktop?
There are quite a few, but both of the ones I have are
commercial. A better approach (particularly if you have a hard
drive) is to change the desktop software. Jinnee is impressive,
but too slow on a ST. NeoDesk is my favorite and others swear
by Thing. All but the last are commercial.

Adding liquid under gentle pressure doesn't change much. I
rather doubt it matters which type you buy, though I've never
wanted to risk it myself. I can't help you regarding refill
materials except to note that it has been done for years.

>Is it possible to get a Deskjet 500 cartridge that is filled
with a color
>ink other than black?
Not from HP. On the other hand, if you buy the color refill kit
you certainly can put in any color you want. Imagecopy, I
believe, actually allows you to print in C+Y+M+B (4 passes with
4 cartridges) to get full color printing from a Deskjet 500.
You need to be careful how you line up the paper though!

I've used a 500 since 1992 as my main printer. Although it
seems to be slowly degrading its print quality, it has printed
many a paper for me.

Hmmm, it IS water soluble, but I'd be concerned about the size
of the particles. Gumming up those little nozzles would prevent
further refills.

Sorry, I meant the manuals that go with v2.01. I have the same as you
described above.

Thanks for the font explanation. That's a shame.
I don't suppose there is a way to convert the SpeedoGDOs fonts.

To be honest, I haven't found an office supply store yet that
didn't have 720K floppies. Go to office supply places for your
office supplies and you'll do better.

5874. LCD monitors on STs?

Newsgroup: comp.sys.atari.st
Date: 2000-05-15 00:00:00 UTC
From: atarigalen <kNOkSPAM@uia.net.invalid>
Message-ID: <0d4c9358.3c7ed736@usw-ex0107-055.remarq.com>
Source record: 62003

I know they're expensive, but I noticed recently that most LCD monitors have RGB inputs. Does anyone know if a LCD monitor could be used with a ST? I don't intend to try it, but I'm curious.

I tried a different cartridge this evening. Same results

A while back I had the drive partitioned to four.
G H I and J. After working on it for a while, I could no longer access
J.
So I partitioned to 3 - G H and I
Then I could no longer access I
Seems like there is some kind of weak SCSI connection.
But is it in the cable or the computer?

Hello Ken,

KK>I am trying to reformat a 200MB removable SyQuest.
why? Partitioning will do all you need. There is a ASCII file 'WINCAP'
(or something similar) that is to be edited for to suit a 'modern'
drive like a SyQuest removable disk drive.

KK>Any suggestions would be appreciated.
Try a more recent hard disk driver, e.g. 'SCSI Tool', CBHD or HDDRIVER.

Do you run a ACSI/SCSI adapter or is the drive being connected
directly to a usual SCSI bus (Falcon, TT, Hades etc...)?

Again: Do not format, but do partition the media!!

Und TTschï¿½

5881. Deskjet Refills

Newsgroup: comp.sys.atari.st
Date: 2000-05-15 00:00:00 UTC
From: taj16@dreamscape.com
Message-ID: <shumdd9mje498@corp.supernews.com>
Source record: 62064

A while ago I wrote about getting a replacement printer for my SLM804. Well, I found a nearly pristine Deskjet 500 at a garage sale for next to nothing, and now I want to learn about refilling the ink cartridges.

I've seen ads on tv for a syringe-and-needle type of refiller, and it looks like it should work well. Of course, tv ads _always_ look that way. Is this the best type? I've seen squeeze bottle types in catalogs, and they don't impress me nearly as much.

Does anybody have any suggestions about where to get ink? I'm looking for a good price, but more importantly I'm looking for a good _value_. I'd rather pay $30 for a pint of good-quality ink than pay $20 for poor stuff. Of course, I'm not adverse to paying $20 for that good-quality ink if I can get it.

What about cartridges? I understand there is a practical limit to how many times a Deskjet cartridge can be refilled, so I'll need new ones from time to time. While I can find them almost anywhere, even the local drugstore(!), I'd rather not pay that much. Where's a good place to find cartridges?

Is it possible to get a Deskjet 500 cartridge that is filled with a color ink other than black? I have an occasional use for green ink, if I could get it. I can use the green ribbon I have for my Epson 9-pin if I have to, but it just isn't the same.

Any tips anyone can give me on using the Deskjet would be greatly appreciated. I've been able to get it working ok on most things, but there are a few that elude me.

even with the syringe, you'll still need to pop open the top of the
cartridge in order to use it. Most of these kits include a tool for
getting it open.

for both of these questions, you might want to try Ink4Art (
http://www.ink4art.com) they offer what appear to be some good deals.
You might also want to check out KorrecType's refurbished HP cartridges:
these use recycled HP shells, I've used these when I had my HP 540 and
they worked well.

BION, I remember reading a letter in ST Applications years ago that
it's possible to use food colouring as a replacement ink for cartridges!

yes golldarn it! that was a bug, in TOS 1.6 i believe???
(correct me if I am wrong)
I solved it for me by saving my dektop in high res and then using that
desktop.inf file to boot in med res.
there are other ways and programs/patches as well.
see the FAQ!! :-)

This sounds like an STE bug. Is it saving the desktop.inf file on your C (or
A) drive?

The workaround for the bug is to edit the desktop.in by hand. There is a FAQ
about the Desktop.inf file available at the QuicK FAQ.

> ST boots in lores, change to medres, save desktop, reboot,
> then back in lores.....Why?

I can vaguely recall a name from around 1988 or so:

Microwave? Microware? Microwire?

Anyhow, whatever happened to them?

Were they bought up in the massive "if you can't beat 'em, buy 'em and
shut 'em down" frenzy of the early 1990s?

> specs?

AFAICR, it was a real time, multitasking (multi-user?) OS designed for
the 68k processor, and available for the 68k micros (ST, Meagre, and
Mac), and later ported to lesser creations like the x86 range by that
small company that virtually no-one has ever heard of [was that IMB?
MBI? MIB?]

Naybe there is something wrong with the cartridge. HDX doesn't provide
detailed error information like, depending on the nature of the problem,
it is provided by other tools. Using another software for formatting
might result in more details about any errors.

I had a similar problem with a Squest EZ drive! it ended up being a bad
quality cable!

Also different formatting software, can give different results. I have also
found a problem when using HDX with one or two types of drives. Try using
other software, like HD Driver, what I use, or ICD which detects drives
NDdriver misses:)

Actually 1.06 and 1.62 are not really early versions of TOS, but they do
have this bug. Another bug (at least in the french version I have) is that
they don't recognize TTP files as exceutable. Once you've edited this in the
desktop.inf it is corrected though.

> ::::}The workaround for the bug is to edit the desktop.in by hand. There

Thing is shareware. There are some freeware ones (GEMini), and some
commercial ones (Jinnee, NeoDesk), but Thing is usually considered as the
best one around.

For a guess you have an STE running under TOS 1.6:(this has a bug that prevents you booting into med res.

There is a program that you stick in the Auto folder of a boot disk, and is freely available and has been used on magazine cover disks, and the STE language disk. If you can't get hold of the file, I'll dig it out for you. Send me an emai; and I'll send it you:)

>
> ST boots in lores, change to medres, save desktop, reboot,
> then back in lores.....Why?
>
> Are there any cool utilities for changing the desktop?

With TOS's less than 2.06, you are pretty restricted to what you can do. In low res there is a program,or two, that will allow a picture on your desktop, but I've not come across one for med or hi res.

You may also think about using a different desktop program: Neodesk (commercial), thing, kaos... there are quite a few. Or alternatively add a TOS 2.06 upgrade!

>Was wondering if SpeedoGDOS is compatabile with Logic 2.5
To the best of my knowledge, no. I mean, Speedo will not prevent Logic from working, but Logic will not be able to use vector fonts.
Logic, in this regard, works exactly like Notator. It can load GDOS (.FNT) fonts, but uses its own driver for that, and does not use GDOS at all. Also it's a pity Logic cannot use vector fonts, its own way of managing GDOS fonts is quite flexible, and the drivers provided give fairly good results.

>A font folder file selector comes up prompting for a font with
>a .FNT extenstion.
Normal, see above.

>Speedo fonts have a .SPD extension.
>How would you access?
You can't :)

>The manual doesn't go into details.
What manual are you refering to? I do not have a Logic 2.01 manual. What I have is a Logic manual, plus 1.6 and 2.0 addendums which came with the upgrade to 2.0.
I have also a complete Logic 2.5 manual, which came with the upgrade to 2.5.

>The Logic 2.01 manual does show the use of fonts like Helvetica
>and Chicago.
>These fonts did not come with the program, so how are they accessing
>them?
Because all screen shots in the original manual were made on a Mac.
That's why also they do not mention how accessing the font on an Atari. To quote the original manual: "All the screen dumps originate from the Mac version, however this is virtually identical to the Atari version".
Virtually says it all.
Logic 2.5 manual is slightly better, because it was made specifically for Atari users (only a few screenshots refer to the Mac version).
However, it stills does not explain clearly how to access fonts.
I only found a clear explanation in the Notator 3.0 manual (chapter 13: Text/Lyrics Functions). Basically, it's not very complicated: once the FNT folder has been selected, you assign a GDOS font to a 'slot', and you can also do some tricks to obtain different sizes from one font. I cannot test it at the moment, because I do not have the LOG3 attached to this computer.
I seem to remember there was some sort of explanation in a README on a one of the disks, but I cannot remember which.

To summarize: the only option is to find GDOS fonts (or create them with
an editor). They were a few provided with Notator and Logic disks,
including special fonts for Chords, etc. You can also find some on ftp.

>Thanks for any help.
Hope this helps,

Correct. And now several other architectures. It is still in use in embedded applications, even if not now on desktop machines.

But these are free as in "free beer", the keys themselves are not free. So ATI have not given away the these. If you want Milan-drivers for the Milan, contact ATI. There's a lot of platforms a lot bigger than the Milan (which is zero ATM) they don't support, so why the Milan? They have to make a profit, and I doubt that the few cards they might sell to Milan-owners is enough for them.

> Matrox has also announced OpenGL drivers for the G200 and G400 cards,
the

OpenGL has absolutely nothing to do with DVD.

> but you also confirmed what I've been saying all along... this will
only be
> implemented when one of the MiNT programmers need it himself...and as
long
> as that doesn't happen the *ordinary* users can wait until kingdom
comes.

MiNT programmers doesn't program for themselves. Why do you think Frank Naumann developed a FATFS from scratch? He's using ext2 himself. Or what about his serial-drivers which is far better than (and compatible with) HS-Modem? His Milan is on a LAN. I guess you want him to get cable-TV and -internet in his home so he could port DHCP for free... Perhaps he would do it if he could get his costs refunded, but charging for software is not something he does (yet). The point is that very few are willing to pay $$$ for something they don't want or need just to port one specific piece of software. There's a lot of other challenges.

> -MinT came with a 68040 compiled and optimised kernel, calling *that* Milan

There's more to it than this, MiNT supports Milan-hardware that differs from the TT (like the MFP) as well as memory-protection on the 040.

> -fVDI supports the ATI Rage cards, but is still beta.... why would I use a
> beta driver? it's beta as long as I can remember, if I would have a Milan

We're all betatesters, the difference is that some people pays for it... I
haven't tried fVDI on an Eclipse myself, simply because Dave Encill at
Titan has ripped me off for 200 UKP and never sent me any hardware, but
the few lucky ones that have Eclipses are using fVDI on a daily basis.
According to them it performs just as well as Nova-VDI, it's even better
on some things.

> then I want optimised stable drivers for it... does fVDI qualify for this?

Yes (I think. fVDI use PCIBIOS but I haven't talked to anyone who has used
it on a Milan. The Milan is not shipped with ATI-cards, and there's no
S3-driver for fVDI.).

> -MinT-Net supports ethernet cards, but that hasn't got anything to to with
> supporting the new machines.

Ofcourse it has, it supports various (mostly NE2000-based
AFAIK) ethernet-cards on the Milan's ISA (and PCI?) bus. Isn't that new
hardware??

> Jo-Even, you haven't convinced me!! the three examples given were there long

I didn't try to convince you either.

> before the Milan, give us three examples that have been specificly written
> or ported for the Milan, while you're at it, what about that other machine?
> you know... the Hades.

Ozk has written utilities to support memory-protection on the Hades. And
then there's the ethernet-drivers. Other than that I don't know, I don't
have a Hades and know very little about it. Oh, there's also the new
HS-Modem compatible serialdrivers for the Hades.

I know that Doom and Quake runs on the Milan and Hades, but I'm not sure
if these require MiNT. I believe Quake does.

>>...at a price ofcourse. $$$$ and the loss of freedom. Count me out.
> Yes, it will have to be payed, but facing the choice between paying for it
> and be able to go online, or not wanting to pay for it and having to wait
> until someone with the right *skills* comes along and port it to MinT-Net,
> well, then the choice is made rather quickly.... isn't it?

No. I'd rather wait for something free (not necessary free beer) or do
something myself. I appreciate my freedom, it's one of the things that
keeps me from switching entirely to the most versatile, powerful and
cheapest platform currently available - Windows.

Is Milan I still available from Systems Solutions? I see that Milan will
offer upgrades to "II" when it is available(?). What are the prices like
now that we are getting 3DM to 1UKP? Is Magic Milan available?

Last time I saw the Hades it was about £1500, is it still?

Has anyone got a Milan for sale, in the UK?

On MiNT-Net, Ethernet is supported for 5 different card models.
Some are VME bus models for the MEGA-STE/TT, others DMA for ST,
others MEGABUS for MEGA-ST.

The point is, it just works.

> >Meanwhile, this TT is connected to the univeristy's ATM line

It works everywhere static IP is available. That's still 90% of
Ethernet usage.

> It doesn't. dynamic IP numbers really need to be supported.

I agree.

Nothing surprising there. Of course, you could do the same as
you do for Magic: pay Torsten Lang to port DHCP.

> -MinT came with a 68040 compiled and optimised kernel,
> calling *that* Milan support is a bit far stretched...

Are you so sure? The Milan kernel actually is designed to
recognize the Milan's special hardware, which is accessed at
different address ranges than on Atari and uses different chips
to achieve the results as well.

One is OK cos the Mega Ste it is based on has a VME slot, and you can get extra Transaputer boards with up to four transputers on each.... I think the ATW800 will work up to 4 bourds = 16 transputers.....they're a wierd little dead-end but in their day they were shatteringly fast....

I can't remember how many transputer chips you could fit
in each ATW machine, but even if you just had two you could presumably
experiment with load balancing and the like. If you had just one chip in there
you could still familiarise yourself with the Transputer architechture (for
historical reasons perhaps).

I'm not sure which "Hi rez" you're referring to, but I
have a vague recollection that ST high res. (640x400) used a 21 KHz horizontal
scan rate, which probably wouldn't work with most VGA monitors (multiscan or
otherwise). I miss my old SM125, pin-sharp it was.

If anyone here's got access to the ST hardware reference
I would be really interested in knowing the exact spec. for high res.

Regards,

I'm in Texas in the U.S. of A. :)

And over here, I've seen TT's going for $100-$200 unmodified.
Roughly $400-$600 modified.

From what I've taken in, the TT 030 is probably the best bet. Overal
better hardware, better backwards compatibility, better expandability. Has a
cartridge and midi ports (along with the appletalk port for whatever good that
is).
Yeh, I think while all other Atari models and clones offer certain
advantages (Falcon - graphics, Hades/Medusa - Speed, ST- Cheap, STE- Fairly
balanced and fairly cheap, Milan - newer hardware/speed), the TT is the best
balanced of all.

This mainly applies for those not on the other side of the pond, because
to me, availablity really figures a LOT into it.

My two zorkmids,

Doctor Clu

It's nearly standard monochrome VGA, 31.5Khz horizontal, 72? Hz
vertical. The main differences are that you get 400 scan lines
instead of 480 (no big deal -- Macs did the same thing) and the
peak voltage is 1V, whereas I think standard VGA is 0.7V.
Anyhow, with an adapter cable, it's plug-and-play with any VGA
monitor I've ever had.

I'm not sure I'm getting through my concern. On my British
Falcon keyboard, <Shift-3> is labled with a British pound sign,
but pressing it yields the "#" character. Hence, I'm using an
American TOS and a British keyboard. If I buy a keyboard at a
computer store, it will certainly be an American keyboard here
in the states, but what will happen when I press <Shift-3>?

Source record: 61946

FamilyNet HQ: Telnet:\\www.family-bbs.net

The question was brought up, would there be a market for a PCI Falcon card for the PC. The answer to that would be, most definately yes. Especially for the music industry. Of course, that is to run the software of the Falcon platform. This would not have the ease and simplicity of the Falcon as a computer, which is half the reason why they are still used.

> Hello Ken,
>
> KK>I am trying to reformat a 200MB removable SyQuest.
> why?

Well, it all started when I backed up my system.
In my music program, Logic, I had a folder called templates.sc
within that was band, choral, etc.
within that were .log files
It did not back up my templates. Instead of escaping, I continued
and the next thing I knew I had a corrupted partition.
I zeroed the partition with an optimizer because I couldn't remove the
bad files.
Everything seemed fine. But then
I think I overwrote the partition while moving some files around.
(copied to many files at once - I think 128) I couldn't open the folder.
The next day I could not access the partition.
I was going to fix the disk partition with an optimizer. But it would
not access the partition.
I had everything backed up so I thought the best thing to do would
be to reformat.
I had no problems formatting it in the past.

Partitioning will do all you need. There is a ASCII file 'WINCAP'
Yes, its HDX.PRG HDX.RSC SHIP.PRG and WINCAP
(WINCAP is a text file used by HDX)

> (or something similar) that is to be edited for to suit a 'modern'
> drive like a SyQuest removable disk drive.
I know how to edit, but I don't think I would attempt it.
Besides, I formatted the same drive in the past with no problems.

> KK>Any suggestions would be appreciated.
> Try a more recent hard disk driver, e.g. 'SCSI Tool', CBHD or HDDRIVER.

Thank you. I will think about this.
>
> Do you run a ACSI/SCSI adapter or is the drive being connected

Basically, through the SCSI bus of a stock Falcon.

> Again: Do not format, but do partition the media!!
Thanks for the advice, but at this point I am burned.
I cannot access the hard drive at all.

It starts to format half way, then bombs!

Teradesk (freeware) is worth checking out on an ST: I used it for a long
time until I switched to MagiC. No long filename support, but that isn't
an issue under TOS. Sorry I can't supply a URL.

Not wanting to start an argument, especially as I may be wrong here,
but isn't the Falcon more backward compatible than the TT? I've found
very little software that won't run on my Falcon (if you include
Backward and other ST emulators for games and such). I've only had a
few of the really old ST games not run, of the ones I've tried.

Also, don't forget the Falcon's audio capabilities as one of its
advantages.

> > This mainly applies for those not on the other side of the
pond, because
>to me, availablity really figures a LOT into it.

Exactly! I'm finding it harder and harder to find Atari stuff here in
the states!

I'd love to upgrade my Falcon with a good graphics card and
additional CPU accelerator (I already have a Nemesis), but there are
no more Nova's or Afterburners (except the *rare* 2nd hand ones) and
it's been way too long since I heard anything new regarding the
Eclipse and Tempest cards, so I'm not holding my breath for those.

If it was a general problem with SCSI on your machine that you would
have problems independent from the partition that is accessed.

> Hence, I'm using an American TOS and a British keyboard.

As you're using a Falcon (I don't assume just its keyboard), you don't have an "American TOS", because that doesn't exist. Just get an NVRAM-configurator like Bootconf from Uwe Seimet and set the keyboard language to match the one you have. It's exactly the same on the Milan.

Ciao

>
>
Hei Thomas.
If your able to get hold of some cartridges and a refill kit
you could try this method. With the colour (color) cartridges try and
empty the Magenta colour.
A.. Carefully prise open the the grey cover cap, you will see three
cells magenta, cyan and yellow. Now Syringe off the magenta as much as
you can. This will leave you with cyan and yellow for you to fill.
Then reseal with sellotape (clear tape) and set to print black.
Eventually Magenta will clear the system and your left with Green from
the mixture of CYAN AND YELLOW.
B.. Problem with Black only is that it has a small inflated bag inside,
as soon as you open the cap. It is effectively useless, only refill
version are better as the space is fill with a sponge.
The two methods open to you, would be to have the cartridge filled at
source or fill the empty black cartridge with equal ammounts of CYAN AND
YELLOW. I hope this will prove useful.

Actually you're jumping in a bit late here, OS-9 was designed for the
6809 processor. Yep a multiuser/multitasking/realtime operating
system for an 8 bit processor that would be happy with 16K (yes that's
kilobytes) of memory. It is still quite widely used in embedded
systems.

I think that the Falcon is a close second to the TT, but let's face it,
the TT030 is better out of the box. Better case, easier to expand, able to use
more common hard drives inside of it, better keyboard. It's also faster and
simply better made.
The Falcon is a different beast almost in and of itself. Graphics wise,
yes, many programs are compatitble, and granted, there are those that were
written specifically for the Falcon. However, I have found as far as most of
the TOS based and cartridge based programs, the TT wins out.

I'm starting to believe, as said before , that an upgraded TT or Falcon
might just be the way to go here in the States. I think my jadedness comes
from the fact that Milan is every unresponsive to those in the states.
Hopefully any other Atari clone makers will pick up on this and realize that
Milan is leaving this market untapped.

Anything that wants a blitter won't run on the TT, but does on
the Falcon because it has a blitter too.

However, the TT is built on more neutral grounds, using the same
design principles as in the STE. The Falcon introduced a _LOT_
of new custom hardware that wasn't on previous models.

Microware was an existing company, making software for the 6800. They
may have been making other software, but what does come to mind was that
they had improved monitor ROMs for the various 6800 systems, as improvements
for the MIKBUGs etc issued by Motorola. One of Microware's monitor programs
allowed for multitasking.

The story I read a long time ago was this. Motorola had designed the 6809,
based on study of how the op-codes of the 6800 were used, and also input
from users of the CPU. The 6809 design was intended to handle high level
languages easily, hence the two stacks and all the addressing modes.

Motorola wanted a BASIC for this new CPU. I never heard what they intended
for the interpreter, to sell it or give it away, or whether they wanted
to show off the fancy CPU or have BASIC available to sell the CPU. So
Motorola went to Microware (and who knows why they didn't go to Microsoft).
Somewhere along the way, Microware decided this new BASIC needed an operating
system, and so they created OS9.

I have no idea how it happened, but one nice thing was that Radio Shack
got behind the operating system, and you could buy it there for the Radio
Shack Color Computer, which ran the 6809, and it was less expensive than
the versions being sold elsewhere.

When Radio Shack came out with the CoCo III in 1986 or 87, which included
memory management and 128K of RAM (and the ability to deal with 512K of
RAM), they also sold OS9 Level II, which needed an MMU, for it.

I had OS9 for the original CoCo, and the horrible screen on the original did not make it all that practical. But Level II on the CoCo III (which had a descent screen) was great. I could load the operating system, and a text editor and whatever other tools I needed at a specific time, and just swtich windows to get to the needed tool. And with 512K of RAM, I never seemed to run out of space. Towards the end of the time I was actively using the CoCo (1993), I added a 720K drive, and the operating system and a text editor and anything else I needed would fit on that disk.

When I moved to a Mac Plus, it was a step backward, though I suddenly fit a bit into the mainstream computing world. The 1 Meg of RAM was pretty much dominated by the operating system. I couldn't really run things with only one floppy drive since the software was so much larger and ended up with my first hard drive. The better computer didn't really give me much better operation.

The sad part was that with a number of low cost 68000 systems, Microware never really came out with a low cost edition. They did have OS9 for the Atari ST for about a hundred dollars at one point, but it did not include any development tools; the full version for the ST was considerably more. I would have loved to run OS9 on a 68000 machine. One of the St magazines once suggested that Radio Shack ought to sell the Atari ST as a logical successor to the CoCo, which did make a lot of sense, especially if they brought OS9 along with it. But that never happened.

On 15 May 2000 19:42:42 , Neil Chester wrote:
>I see that Milan will
>offer upgrades to "II" when it is available(?).

Apart from a complete motherboard swap, this will
be practically impossible. The distinguishing
features of Milan II would be difficult to
implement as a plug-in upgrade to Milan040 (as some
had been hoping for). For a start, Milan II will
dispense with the outdated AT keyboard and PSU
connectors, replacing with PS/2 (or USB) and ATX
respectively. This would mean changing the case
and power supply.

Next is the 68060 and SDRAM. This calls for
3.3V CPU core voltage (instead of 5V) and 3.3V
local bus and new memory controller for the SDRAM,
which means either a new PCI north bridge or some
other way to convert the 5V local bus down to 3.3V,
not to mention new sockets to accomodate the
different form factor of SDRAM DIMMs, and the
integration of a graphics chip and anything else
that Milan II might settle on having built in rather
than plugging in. Milan040's local bus also probably
wouldn't be stable in the 68060 full-speed bus mode,
if that is also implemented.

There is now also the very attractive possibility of
using a PCI south bridge with ATA66 support. These
are now becoming the norm (Intel 810/820/840, VIA Apollo
Pro 133/KX133 and AMD 750 chip-sets, for example) as
EIDE drives get extremely fast (some mechanisms now
pushing past 40Mbyte/s to and from the actual media)

That would be some daughtercard if it ever appeared.

>Is Magic Milan available?

Yes, in German.

>Last time I saw the Hades it was about ?1500, is it still?

Depends entirely on configuration. I know Hades
users with anything from 16 to 512Mbyte RAM,
no CD-ROM to CD-writer, 14" to 21" monitor,
no sound to speak of but the YM2149 to the

almighty ?500+ SWE Startrack...

Well, itï¿½s true, thereï¿½re not many applications with show the abilities of the Falcon. The most impressive things Iï¿½ve ever seen for my Falcon were "Apex Media" (Iï¿½ve never seen a better gaphics program, especially on a PC platform) and "Neon Grafix 3D". These softwares make a new hardware interesting. Milan & Co need programs with show their abilities in the same way, but nobody seems to be interested to make software like this. Smurf is a nice GEM program, but I personally didnï¿½t know what to use it for...

Which is one of the big reasons the Atari systems died.

I know a lot of the programmers who left the Atari world for just this reason.

Everyone wants software for free, but these guys had families to feed, so they ended up going into marketplaces where they could get paid for their work. Just like everyone else likes to be paid for working.

Free hobby programming is nice, but it can't support a computer platform for very long.

Hmmm,

I often wonder if a market exists, USA, Europe, Australia, Canada, etc that would buy a Falcon-on-a-card. One that would fit in a PCI slot. With some major improvements, ie. speed, sound, graphics, memory, . Either as a standalone in a PCI bus system, or with the WIN enviornment-as a basis for a midi system that didn't have the problems of the WIN system.

Thanks for reminding me...

I paid Denesh for the Aniplayer key about 4 months ago, and e-mailed him repeatedly thereafter without a reply. I did finally receive a response a couple months later - BUT NEVER GOT THE ACTUAL KEY (although it _was_ promised "when he could get around to it..." "so busy..." etc.)

However, Didier Mequignon supplied me with a key himself (partly due to a bit of beta testing I did for him), but mostly because he is an honourable guy - not to mention a very talented programmer! ;^)

I won't say anything _really_ bad about Denesh, but I also will NEVER pay for or register any software with him ever again.

BEWARE!

Why, do you need one? ;^)

Actually, I just created the CD jewel case inserts myself in PageStream, using the on-screen rulers, and a bit of printing "trial and error" to get the sizes right. And for any future inserts, I just start with the basic outlines (template, if you will) and go from there.

If you use PageStream, and want a copy of them for your own use, I'd be happy to e-mail them to you.

5956. Falcon Keyboard Getting Tired?

Newsgroup: comp.sys.atari.st
Date: 2000-05-17 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <8ftab501oo6@enews2.newsguy.com>
Source record: 61952

My Falcon's keyboard is getting a bit worn out I think. :^(

Certain keys like "v", "2", [CONTROL], and "j" seem to occasionally not work. The situation improves a bit as the keyboard is typed on during a particular session. But when the computer is first booted after sitting for a day or so, they can take a bit of "working in" before they function reliably.

About 5 or so years ago, I _did_ install those TT-Touch keyboard contacts, so I'm thinking some of them may be getting worn out. I know I have some extras, as well as my original "mushy" key contacts, but does this problem sound like something more is wrong, like maybe:

- Aging / cracked traces?
- Partially unseated chip?
- Chip going bad?

Any suggestions before I open her up and see what's going on?

P.S. I do have my old STE in the closet, so I guess if the keyboards are compatible I could swap that one into the Falcon???

P.P.S. And I do like the idea of Mario Becroft's PC-keyboard adaptor, but seeing as a very nice PC keyboard can be bought for less than $10 USD here in California, the ~$69 USD price of the adaptor seems a bit steep for me. (no offence Mario!)

It's most likely the "mushrooms" that's worn out.

I've been following this thread with some interest. It seems everything you've tried should have worked, but it hasn't.

First suggestion, find a PC owner who SyQuest. See if the SyQuest comes with it's own set of formatting routines, and have him format the cartridge for you, then try the HDX utilities on it. Even now, if you have an Iomega ZIP drive, you still format using Iomega's routines from the start bar or elsewhere.

And a suggestion of last resort, since I don't know how the SyQuest does it's thing: Way back in the days of 5.25 floppies and 8-bit technology, I'd often have a floppy that wouldn't format. Knowing that everything was magnetic, one day I tried holding the floppy against the face of the tv I used and turning the tv on and off 3 or 4 times, thus forcing the magnetic field to "grow and collapse" around the floppy. Most of the time, it worked!!! I could now format the floppy. Eventually I improved the system by using a refrigerator magnet!! LOL When the ST came out, I'd take PC floppies home, do the magnet thing, and then format them with my ST that had a 5.25 floppy drive attached, write the DOS info on the disk, and take it back to work. People were amazed.

> seeing as a very nice PC keyboard can be bought for less than $10 USD here
> in California, the ~$69 USD price of the adaptor seems a bit steep for me.
> (no offence Mario!)

ah well, no use in torturing yourself then is there? :-)
how steep would the price seem if you had no keyboard?
69U$A is a great price because:
1)you don't have to worry about laying your hands on a good keyboard
ever again
(and unlike DEKA, Qwertyx allows you to configure the keyboard)
2)you needn't concern yourself with finding an atari mouse from a
shrinking supply.
3)your are supporting an active developer because you want/need his
future products
(i.e. ethernet, ...)

I've purchased Mario's products because they are useful, and I want to
support continued _hardware_ development.
I have not "needed" anything I have purchased, but I will need what is
to come. I have seen so many developers fall by the wayside that I've
determined that if there is anything *I* can do about preventing that, I
will do it.

I understand your point of view, it is the most common point of view,
one that says that money is everything, the cheaper price is the better
price. I also have had this point of view. But I am also looking ahead a
year or two.
When my Falcon keyboard goes, what happens if I cannot get a
replacement? Or if I have to wait for two weeks,
or scrounge around for some old ST's (if I can find them). So I buy a
Qwertyx from Mario and I do not have to worry about this, I get choices
of nice keyboards, I get choices of nice mice, or trackballs, or maybe a
glidepoint, and I support continued Atari hardware development, which
will also help me down this road I am on.

There is a saying you may also know. That of being penny wise but pound
foolish.

Source record: 61959

Just received a new shipment of the following items which are back in stock and ready for immediate shipment:

- TrueMouse: In my opinion, the best mouse ever for the Atari system. I've been using one myself for years. $27.95 plus shipping.

- Atari Handy Mouse: actually its a hand/palm held trackball that can also be mounted on the front of your Atari keyboard if desired. For either left or right handed users with its 3 left mouse switches (one under the trackball itself, and the other two at the 11 o'clock and 1 o'clock positions; the right mouse button is located at the 6 o'clock position. Comes with a 5-1/2 foot cord and top side removable ball locking ring for easy cleaning. $27.95 plus shipping.

Priority Mail shipping charge for either item is $3.20 within the continental United States.

Reply in Email if interested.

Sheldon

Actually, I have a 68060 sitting in my Milan I - the upgrade consists of an
adapter with a 3.3V regulator, 1 TTL chip and a new bootblock/TOS.

However, you are right that the other features of a Milan II are not easily
added to a Milan I board.

>than plugging in. Milan040's local bus also probably

Correct, the above machine runs in halfspeed mode with a 30MHz bus.

Start with a clean system, if youve a boot selector just configure it to run the NVDI software. Once thats etup you should be able to run it in any configuration.

Tell us what you have so far?.

Bitstream Speedo fonts [*.spd] can be converted to bitmap
fonts using a German-made utility [I'll look up the exact name
and uses later on].

According to Jos it's fixed but he probably hasn't found the time to
update his page yet.
Hmm, what puzzle me is that IIRC -correct me if I'm wrong- that problem
only occurs under plainTOS and not under Magic or N_AES.
But you're using Magic so..
Anyway on my Hades I don't have any problem with that metric converter be
it under plainTOS (modified TOS 3.06) or N_AES.

I did get it to work once, but it didn't seem to have any sound support (the games were completely silent, anyway), and since then, I haven't been able to make it work. It simply crashes immediately upon startup. The STe_X programs do ok, but aren't as compatible as Backward, it seems.

That's excellent news! (especially if the 72Hz vertical is right)
400 lines is normal for VGA monitors in text mode, which would seem to tie in with the compatibility you describe, don't call it "plug- and-play" though - that's come to mean something altogether far more nasty! The adapter cable you mention, does it attenuate the video signal by 30% to compensate for the difference in levels? Hmm, were they 80 dpi monitors (8" x 5" picture for 640 x 400)?

Regards,
- Andy.

The vertical is indeed 71.25Hz. Most monitors, I'm told, handle
the 1V signal without problems, but the adapter I once saw did
indeed reduce the signal to 0.7V via a few resistor looking
things. I believe Mario Becroft has such a device for sale that
an Atari group in Canada once used on a video projector. Anyone
care to chime in?

5991. Hippo Eprom Burner?

Newsgroup: comp.sys.atari.st
Date: 2000-05-17 00:00:00 UTC
From: Schoengarth <dons@qnet.com>
Message-ID: <39237D19.99EC783B@qnet.com>
Source record: 61987

I just purchased a Hippo EPROM burner with all the docs, software, and hardware needed to burn EPROMs. Does any know of any software upgrade that may have come out for this unit? The manual only talks about 28 pin EPROMs I was hoping to use it to burn other varities(ie 2532 24pin). I guess I could try to make a 2532 EPROM the worst thing it would do is kill the eprom.

Well if anyone has any information on this burner or has this burner please let me know if it can use other than the 28 pin 2764-27512. I know there is others that it can burn but, want to make 24 pin EPROMs.

Thanks Don

5993. I still love ATARI

Newsgroup: comp.sys.atari.st
Date: 2000-05-18 00:00:00 UTC
From: joey6373@my-deja.com
Message-ID: <8g0ft9$lh4$1@nnrp1.deja.com>
Source record: 61896

Dear Atari Community,

Hafa Adai (a-day), Hello from Guam (usa) Atari world!

I still believe Atari computer is, (for myself) a beautiful or a "Dam good computer". I am an owner and proud of it to own a Falcon and also 8-bit computer (800xl with a 1050 drive), and living and born in Guam (usa). I am still new to Atari even though, I do own 8-bit computer since 1986, as a gift from my uncle before he died. And I used to subscribe to Atari magazines like Analog, Start, and Atari Explorer hoping to catch the latest or news from Atari world. Then early ninty's I first ever purchase Atari computer on my own, and going against my family and friends decissions about it. I heavyly rely on internet or news groups now than before to catch the world of Atari.

My questions: Can Atari able to be back anyway? Yeah, I know I am kind of late here but just have a dream or heart about Atari ever since, I used to own Atari 2600 and kept an eye out on Atari computer later on. Since Hasbro owns the rights of it. Is it possible to bring back ATARI really? I do think it is possible that Atari do have its own flavor, and attractiveness to it. Why not open source? or designing and building it ourselve's? or Motorola company? Sorry for the questions just bring back Atari!!!!

Anyway I just hope that Atari should look more of creating a beautiful and attractive computer someday. Oh not to mention powerful (Atari people's) computer like also beautiful people too. I do hope to have my Falcon computer up and running (flying) soon as possible. sorry for the long and boring letter. Hey this is my first time.... Why not. ^-^

Sincerely,
Joseph T Guerrero

PS
I love you Atari.... Why not create and design ATARI ourselve's?

Sent via Deja.com http://www.deja.com/
Before you buy.

It was shareware (at least the releases I have). I have two versions at leats and I think the later ones had limitations of some sort (i.e. maximum spooled file size of 10k, or such like).

Let me know via email if you want the files.

Regards

"Designing and building it ourselves" is exactly what the clone makers are
doing right now: Milan and Medusa.

I have downloaded 4 yes 4 compacked disks for the emulators and tried to transfer them to disk to play on my ste, every disk unpacked very well using makedisk, but when they are booted on a real st the game goes through the cracking intro and the all i get is a black screen? is this normal or is it me.
The only reason i reserected my STE was to play 4 games, DUNGEON MASTER, CHAOS STRICKS BACK, SHADOWATE and SIDEWINDER.

Please has any one got any answers to this problem?

Graham

> From: joey6373@my-deja.com
> Dear Atari Community,
> Hafa Adai (a-day), Hello from Guam (usa) Atari world!

Hafa Adai mi amigo!

Well something like that. I remember from living in Guam for a year that
the language there (when it was used) was partily Chamarro and part spanish.
When it was used. :)
Good to hear from an Atarian on that part of the world.

> I still believe Atari computer is, (for myself) a beautiful or a "Dam good
> computer". I am an owner and proud of it to own a Falcon and also 8-bit
> computer (800xl with a 1050 drive), and living and born in Guam (usa).I am

> from Atari world. Then early ninty's I first ever purchase Atari computer on
> my own, and going against my family and friends decissions about it. I
> heavyly rely on internet or news groups now than before to catch the world of
> Atari.

Seeing that you own a Falcon and an Atati 800xl, have you picked up a copy
of 800xldj? With that program, and what I like to call a SIO2ST interface
(more commonly known as a SIO2PC interface) you can have the 800xl using the
Falcon's hard drive as eight virtual drives. Makes for much faster boot ups,
less wear on your actual 1050 drive, and easier to import Atari 800xl files
from the internet.

If you need help getting an "SIO2ST" cable, let me know and I can point
you to a few people.

What is really funny is I remember visiting a goodwill in Guam and seeing
an Atari 800 sitting on a pile of donattions. I remember looking at it and
thinking warm thoughts about a computer I used to use. Or maybe it was just
the sticky warm Guam day.
Anyway, never would have dreamed I would be playing with Ataris again five
years later.

> My questions: Can Atari able to be back anyway? Yeah, I know I am kind of

> Joseph T Guerrero

> PS
> I love you Atari.... Why not create and design ATARI ourselve's?

Guerrero... now there is a name you don't hear everyday on Guam. (grin)

Truth is, I think that is what we do. Mostly as hobbyists, but have you heard about the Atari clones, like the Hades, Medusa, and Milan? Pretty nice machines. And nice emulators for the PC and Mac platform that run the GEM envoronment real nicely.

I think the Atari platform will at least continue on as a session on a computer, or as a special application somewhere on a newer computer. But then, there are always those that like to run the original equipment or something just as dedicated.

What fun.

> rest of the U.S. I mean ;o)

Hehehe... there are times we've been tempted. But honestly it's not a all
bad country. Just be better if there was more Atari over here.
I have to say that America, and especially Dallas Texas was quite the
hubbub for Atari activity. From the late seventies till the late eighties
there were all kinds of companies and developments going on for various
systems. And the Atari service center was in this area for a while.

>> And over here, I've seen TT's going for $100-$200

>> LOT into it.
> Are they more available this side of the pond then (I'm
> currently in the U.S.)

At times, though I have noticed that the idea of high end usually tends to
be a MegaST sometimes a TT. And if you run into a midi musician, a Falcon. :)
So where ats on this side of the pond do you reside?

>> My two zorkmids,
> You don't happen to know the current zorkmid <-> blungle

> Regards,
> - Andy.

Well, considering my opinion is more than likely not worth all that much,
I have to say that a zorkmid (especially since it is from a rather ancient land
that MOST believe to be extinct...) would more than likely exchange for much
less than a a blungle. :)

Apparently you _don't_ understand my point of view, because I _do not_ take
the attitude that "money is everything". Take a look at my Atari investment
over the years and you'll see what I mean.

> When my Falcon keyboard goes, what happens if I cannot get a
> replacement? Or if I have to wait for two weeks,

> There is a saying you may also know. That of being penny wise but pound
> foolish.

Having used _only_ Atari computers faithfully since 1983, and having spent thousands of dollars on hardware and software, and supporting countless companies and shareware authors that then abandoned the platform, I don't feel I need a lecture from you or anyone else about being "cheap" or _not_ supporting Atari and it's handful of remaining devotees.

The product sounds great, but I'm mainly going to be using the Falcon for MIDI/music now that I've recently acquired a PC to handle Internetting and probably other tasks as the need arises (more out of necessity than anything else, as CAB 2.7 and other things have just fallen too far behind, and it's limiting what I can do on the Falcon - even with it's Nemesis).

I've been more than willing to invest money into the platform over the years, and continue to buy the occasional commercial software offering, and supporting shareware authors when I can. As a recent example, I registered Aniplayer, bought CD Writer Plus from Anodyne, and updated Image copy. And I spent a few hundred dollars on a Yamaha CD-RW drive and case for the Falcon recently as well. I use the Falcon daily, but recently I've been using this older PC I acquired for web browsing, HTML authoring, and image processing because it's simply better for the task at hand.

I love the Atari platform and will continue to do so, but there comes a point when I have to decide if it's worth pouring any more money into it. Spending $70 so I can use an $8 [brand new] keyboard seems a little silly to my rational brain. Yes, you pointed out the other features too, but I don't need them. I have about 5 Atari compatible mice - all working fine, and several old STs and STEs that I can part out if needed. And with the Falcon eventually being used only for music/MIDI with Cubase Audio in my studio, I don't know that I'll really be wearing out mice like they are going out of style. ;^)

Anyway, thanks for the tips. No hard feelings.

>I am
>still new to Atari even though, I do own 8-bit computer since 1986.
New! I got my first computer at the end of 1995, an STe. The bloke I
bought it off said it had 8Mb of RAM. Rubbish it had 1mb and he never
mentioned that I needed a TV to play games. Still my main computer
though, got no Pentium or Mac.

>Yeah, I know I am kind of
>late here but just have a dream or heart about Atari ever since.
Yep, so do I.
Hasbro are making games for the Playstation e.g. Pong (new version).
Now I bet I'm the only one who saw the advert. At the end a massive
fuji filled the screen with the word Atari at the bottom. I remember
it so well (4 monthes back now) never seen it again. ;-(

>
>Anyway I just hope that Atari should look more of creating a beautiful and
>attractive computer someday.
>
They will one day. Times are changing and things are not going right
for Microsoft. When the markets back, maybe even 5-10 years, ATARI
will be back in there with the big boys.

>I love you Atari.... Why not create and design ATARI ourselve's?
Thats what Milan are doing for us. They're creating the most powerful
Atari ever, how I don't know, where the hell are they getting the
money from, and why did Motorola agree to make it?

The only thing we need people to do is to support it and programme new
software. It will be difficult but one day, one day we will be seeing
Ataris back in the shops at affordable prices offering something that
no other computer can.
I'll do it if no one else will (yeah right).

Source record: 61908

Well - I have achieved a partial solution to the problem!

The GE Soft Adapter & software would recognise the 2 hard drives and the cd-rom, but my ICD Link2 and software have done!!

Solution is to sell my mate the Link2 as well as the drive - this means that his system is back up and running. I'll have to contact System Solutions and buy a Link97 from them :((

Ah well - further developments are that my tower now won't work unless the Link2 is connected and at least 2 of my hard drives are showing signs of a death rattle !!

Does anyone know where I can get hold of SCSI hard drives at reasonable prices :)

I don't want huge capacity ones - 1 or 2 Gb would do fine - it's thew working side that's more important! :))

sorry dude. I was responding to your comment that you thought 69U$A was
a bit dear.
I can't know how much you have spent in the past, or how much you will
spend, eh?
But look at the difference between a DEKA priced at 99U$A, and the
Qwertyx at 69U$A,
and compare the capabilities. Qwertyx is *very* reasonably priced. It
can only be
considered "dear" if you don't want or need it, or will not spend any
money on your system at all.

well. when you say 69U$A is a bit steep, you understand that I have to
respond to that.
I don't think you are being cheap at all, just wrong, misguided, and
lost. ;-)

how is this for an interesting coincidence...
a fellow who makes music at SONY canada, only uses the ST for MIDI, and
says
he goes through about a mouse a month. something tells me he gets
frustrated at times! :-)
I just passed on Mario's serial cable to him. now he can abuse PC mice
and leave the -noble- atari mouse in peace.

Hard drives have never been better value, and therefore as
reasonable as they have ever been. What you would have paid
for 1 or 2Gbyte a few years ago, now buys you 9Gybte.

>I don't want huge capacity ones - 1 or 2 Gb would do fine

9Gybte is entry-level for SCSI, there are simply no smaller
capacities manufactured now (likewise, try buying an inkjet printer
these days that doesn't do colour...). Unfortunately, even these
are being phased out, in favour of higher-bandwidth versions
of SCSI (16-bit instead of 8-bit).

For smaller capacities, you'll need to do some scouting around
for old stock.

Basically my friend brought in his TT with the card installed. We fired
it up and got nothing on the monitor. He was sent the drivers, but they
did not work. Another gent told me they were no good and to have NVDI 5
drive the card. I am in the process of doing that. If anyone has set up
NVDI to run a VME card, I am open for pointers.

It occured to me that this might be hard to do, so a bit more info.
I accomplished this by hooking up 2 monitors, one on the card and one
on the old video port. Boot the TT to the old TT med rez and then run
the vmg4000. This way you will see the vmg4000 on the old port
and can test the monochrome mode in realtime on the card.

The vmg4000 program is able to kick the card on and off at will
even if you didn't boot the video card correctly.

Well it's a matter of having the original nvdi disks, enter your
key info and hit the et4000 option or the crazydots option,
I forget which way it's actually worded. Let it copy all
the files and do it's thing and reboot. If all went ok
you should get a rez selection screen.

The only other problem I can think of might be the rez selection
that is suppose to appear. I don't think it will appear unless
it finds a mode defined as 640x400 in monochrome. I assume
it does this to avoid blowing up a monitor, so it uses this
low end mode for the menu. Anyway, if you get thru the install
ok and still no picture do the following.

Run the vmg4000 "video mode generator" program in the nvdi tools
dir and create/add a mode that is exactly 640x400 in monochrome.
Save the new mode data to the nvdivga.inf and make sure this is
tossed in the auto folder also.

Should have redirect.prg, nvdi.prg, and sltc_dev.prg in the
auto folder, in that order.

Very hard to know what is going on without seeing it first
hand, but if i recall I did not have the 640x400x1 mode
when mine installed. Been awhile and I forget really.
In the manual I think is where I discovered a clue to this
perhaps.

Good luck...

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump

to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Which decompresses onto a RAM disk, hence the 8 Mb RAM required. Still fairly impressive, but it's by no means an entire OS and the web browser is pretty limited in functionality.

Go for it! Just make sure it has TOS 3.06, HiDensity floppy, and as much
RAM as possible - with Fast RAM too. You'll love it. I also think that
multitasking (of whichever sort you prefer) is a necessity, if you have
large RAM to play with.

Charles.

Hi,

Some time ago I bought a used copy of 'advantage tennis'. It came boxed
with manual and everything was in mint condition. When I booted it, the
program asked me to enter some code which I didn't know.
I phoned the dealer where I bought it if there was some code sheet that
he forgot to send and he promised to look but although I phoned him
several times I never got the needed information.
So maybe somebody here can help me please ?

Ah ha!, a clue. What are you using for a screen font?. Perhaps you could try freaking the font settings using MagicCNF, Do you have NVDI, what setting do you have in PRESET.PRG for LINEA, also, what settings do you have in MAGXCNF.CPX for smart redraw?.

The following is meant to be factual and not bashing!
If this is the same Denesh associated with Cyberstrider, you don't have to
worry about buying or registering Atari software with them since they no
longer sell or support same!!! I tried to buy some stuff from their site
but the Atari page led to a dead end and a bunch of contradictory E-mails

from Denesh!!!

It would appear to be due to 2 things... 1, the floppy drives physical limitations, and 2, (more likely) the pc's floppy controller cant cope with being told to format outside standard pc disk format's. Cheap controllers will probably be worse. Oh, also the operating system can cause drama's too. Win NT seems to hate it as well.

6032. Wanted - decent, free terminal emulator for ST

Newsgroup: comp.sys.atari.st
Date: 2000-05-19 00:00:00 UTC
From: afoster@mrbusy.compsoc.man.ac.uk
Message-ID: <slrn8iaeu9.5c4.afoster@mrbusy.compsoc.man.ac.uk>
Source record: 61927

Hello...

Over Easter, I was playing around with my old Atari ST and my big, chunky K6-2 450. I successfully turned the ST into a dumb terminal using a null modem cable, Atari's ancient VT52 desk accessory, and Linux on my PC.

The VT52 emulator worked surprisingly well; much better than an old 386 running Kermit. Not a single character dropped at 19200 bps, compared with the 386 dropping characters at 4800 bps (it's a very old, 16MHz 386 SX). The only problem was that many newer text-based Linux programs benefit from a slightly more advanced terminal type, such as a VT100.

I downloaded a copy of Teddy-Term (I remembered it from my old BBS days), which did pretty good VT100 emulation, but it was pretty slow, and trapped lots of vital control keys for its own use, making programs like Pine and Pico unusable. I couldn't find any option to turn this off, so I gave up.

Could someone recommend a good, simple and free terminal emulator? I don't need any file transfer capabilities, phonebook facilities or anything, just good, fast and ultra-compatible VT100 emulation. It's a pretty high-spec ST, with a 230MB hard disk, 4MB RAM, TOS 2.06 and NVDI 4.11.

Any ideas? I've found the ST pretty useful already, such as when a somewhat unstable 3D driver managed to lock up X, requiring me to log in via the ST and dispose of the dead process.

Many thanks...

Adam Foster

I have a "Viking 2" monitor which I used to run off my mega4 ST. It plugs into a D15 connector rather than the normal monitor socket and uses special drivers (and its own version of GDOS) to produce a very large, extra-high resolution screen. I'm now using an STe (not mega) and can't see any way of using the monitor with this machine.

Can anyone out there make use of it? It produces a lovelly, sharp picture and makes applications such as Papyrus easier to use.

I had the same problem running under Windows 98/NT.
load your PC into a dos prompt the F8 key and run from there it works fine.

Graham

It makes you think!

But back to these drives - I'm extremely confused by all this talk of wide
and ultrawide interfaces. I'm guessing that I can use any of them with an
Atari (in my case a Falcon), but I may need some kind of adaptor?

```
You can get ConNect, which is a free fully fledged terminal emulator from:
http://www.oelwein.de/philipp/

The site and program is in german, but there is an english .rsc file in the
download section.

As Nick says, there is always Connect which went PD some time ago.

You could also try the (rather ancient) Uniterm which should be on all
download sites.

Roger

I believe that theres a graphics card in your Mega that is required in order for this monitor to be used, IIRC it is useless without it, so i'd say you'd have to offer the card and software for it.

I'm after the shematics for the joystick adapter that's used to plugin
to printer port for an extra 2 joystick ports there were only a handful
of games that used it such as Gauntlet 2. If any body can help I would
be grateful because I don't want open up the original adapter the
reason I want the schematics is so I can make one for a friend instead
of me lending mine all the time.

You could make a conversion socket that converts the 2532 pinning to
27xx pinning, xx being the type that offers the same signals and programming
voltages. Make sure that the exess over 4kB is not programmed or that it
contains FFh (all ones) or that the image contains as many copies the 27xx eprom
is bigger. You can also OR the missing address lines into CE to avoid reprogramming
the lower 4k.

6049. Re: the ST is dead

Newsgroup: comp.sys.atari.st
Date: 2000-05-19 00:00:00 UTC
From: Don <dons@qnet.com>
Message-ID: <3926221D.D3CED77F@qnet.com>
Source record: 61944

I told myself I wouldn't get involved in this post but, here I go.

I really dont think the ST is DEAD nor will it ever just fall off the face of the earth. There are way to many people using it for music composing ,games, and other great apps. I think what still atracts people to the ST is the MIDI. There is no way a struggling musician could afford a PC that is capable of doing what the ST does for under a $100. So when they start out they turn to the most practiable computer that will do everything they need it to do. I have also see in the past few years alot of TOP10 musicians still using a ST or Atari of some sort. Two years ago it was the guy from Europe who made a TOP10 hit in his bedroom on his ST. Today its another group in the TOP10 using a ST. I personally didnt know they were using the Atari but, after seeing them at a concert in California I noticed what I thought to be a Fuji logo on the sleeve of the band members. I went home started looking to find out more about the group and came across this page: http://www.blisscorporation.com/e/company.htm

Take a look at the small pictures and you tell me what those grey computers are doing in the pictures. So it just goes to show the ST is not dead and people are still using them around the world.

I have also written to the company that has the pictures on there web page to find out what exactly those gray computers are. I hope to get a answer soon. BTW, the group and company are from Italy.

If you cant figure out what song they are responsible for its the song called BLUE. I know everyone has heard the song BLUE from EIFFEL65.

Don

Message-ID: <39260d3f.61981288@news.cox-internet.com>
Source record: 61848

'Ello all.

I just received a 1040 ST, but it didn't come with a monitor. I've checked the specs, and have a multisync II that'll handle it just fine, but need a 13 pin DIN plug to make a cross cable. I could just add a DB9 connecter where it looks like the RF circuitry would be (btw, what's the deal with that? did only some versions come with the RF, or was it just deleted before production?) and solder a set of wires between it and the appropiate pins underneath the DIN 13, but I'd rather try at least doing a cross cable before soldering.

Does anyone know a source for a 13 ping male DIN?

Thanks all,
Jay

P.S. Remove the NOSPAM to email me.

>Depending on where in the world you live, they are available from Radio
>Shack, Maplins or Conrad. Ask for an Atari 13 pin DIN socket.

I think "Atari" will confuse matters. A 13-pin DIN is a 13-pin DIN
(not accounting for mounting type or contact plating). That's the
idea of DIN - standards.

6055. Re: Falcon Keyboard Getting Tired?

Newsgroup: comp.sys.atari.st
Date: 2000-05-20 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <8g5dkn01r4o@enews4.newsguy.com>
Source record: 61851

On 18 May 2000 13:34:34 , Ken Macdonald wrote:

>well I'd like to use ethernet to network my ataris and use the internet.

That would no doubt be very cool, but with regard to Internet connectivity; until a better more capable browser is made for our Atari's, it's a bit like putting a Holly four barrel carburetor onto a lawn mower engine, isn't it?

>sorry dude. I was responding to your comment that you thought 69U$A was
>a bit dear. I can't know how much you have spent in the past, or how much
>you will spend, eh?

"Dear"? Must be a Canadian term, eh? <hehehehe>

Seriously though, let's just say I've spent "more than you can shake a stick at" on Atari related products over the years. Check out my web site if you want more information.

And it's not that I think Mario's product isn't worth the money, it's just that in the grand scheme of things, when _PC_ hardware is so cheap, the idea of paying $69 USD to connect to my Atari, what would connect to your average PC without any additional expense, just sort of "rubbed me the wrong way".

BUT... [it gets better!] ;^P

..the more I thought about it (after you mentioned the other features etc.), it does seem like a good investment. After all, I plan to keep this Falcon going for quite a while in my studio (and with other things too!), and who knows when the keyboard might completely fail?

Plus, it will be more convenient when I relocate my studio to another [larger] room - where the Falcon might not be as "close at hand". The addition of a corded PC keyboard could prove very useful.

So...

I think I'll be putting in my order for one just as soon as I find out if Systems For Tommorow or Chro_Magic has one in stock! :^)

>But look at the difference between a DEKA priced at 99U$A, and the
>Qwertyx at 69U$A, and compare the capabilities. Qwertyx is *very*
>reasonably priced. It can only be considered "dear" if you don't want or
>need it, or will not spend any money on your system at all.

There's that "dear" term again... ;^P

>well. when you say 69U$A is a bit steep, you understand that I have to
>respond to that. I don't think you are being cheap at all, just wrong,

>misguided, and lost. ;-)

That may very well be. Hell, I _do_ now have a PC up and running in the other room for web browsing. And I'm actually starting to _like_ Internet Explorer! <yikes!> Although I don't much care for Outlook Express - but I found a cool little shareware e-mail client called AK-Mail - nice!

>a fellow who makes music at SONY canada, only uses the ST for MIDI, and
>says he goes through about a mouse a month. something tells me he gets
>frustrated at times! :-)

Well, he seems like an intelligent idiot to me. Intelligent because he uses an ST for MIDI, an idiot because it seems to me that he's either not familiar with the concept of cleaning the mouse; or he enjoys throwing them against walls when he's frustrated!

My STE's mouse from 1990 still works great, as do the even older spares I acquired used, and my Beetle mouse, and of course, the wonderful Alfa Data mouse I've been using with my Falcon since 1994 or so. But that's just me... ;^P

>I just passed on Mario's serial cable to him. now he can abuse PC mice
>and leave the -noble- atari mouse in peace.

Sounds like a good idea!

Of course, PC mice are probably even more fragile (but - "a dime a dozen")

-Paul

>>equipment).

>Just must have good eyes to read size 9 :-))
Tried size 8 but that *was* toooo small ;-)) I think it's more a resolution
thing with the size - it's not too small with 640x400.

>PS. Which font are you using?
Standard System font. I've checked it with other fonts and it seems ok.

Pascal wrote:
>> *Very* consistant Okami crash (2 bombs) here using MagiC 6.01, NVDI 5.03.
>Ditto (Magic 6.10 here).
Thanks Pascal, that's a releif I was beginning to think it was me! ;-)

[Screen redraw problem within messages or articles]
>Well, I'm sorry, no problem here with size 9.

Ok, thanks for checking. With my standard screen resolution 640x400 mono I
find that other fonts don't look too great so that's why I stick to the
system font. Looks like I'll have to use the "big" system 10 font! ;-)

6064. Midi Draw Released as Freeware!

Newsgroup: comp.sys.atari.st
Date: 2000-05-21 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8g9a75jrr1@nnrp1.deja.com>
Source record: 61860

Hello All:

I am happy to announce that Frank Balde has released to me MIDIDRAW as FREEWARE. (only took 2 months of constant email!)Here is a short description:

MIDI DRAW Version 1.00
By Frank Balde 1988 Intelligent Music
The program that performs your pictures.

During the time that Intellegent Music released "M" and other algorithmic applications came out (late 1980's)such as Tunesmith,Music Mouse,and Fingers, Frank Balde released "Midi Draw".This was a "drawing program" that actually played midi events.You can have several parameters that you specify such as tonality,program change, durations, velocities, tempo, ect in which the drawing that you create "plays" those specifies parameters. The results can be quite facinating.A Midi Graphical Drawing program.

You can get it at my original site or my Mirror site:

http://sites.netscape.net/timconrardy/mididraw.htm

Would like any comments.

Also I would invite any of you to join the Atari-Midi mailing List. Dr T even joined us, so we are having a good time discussing Atari-Midi related items
ENJOY!
Tim

Hi Ken,

KK>I wrote to the newsgroup earlier about trouble formatting a SyQuest
KK>200MB removable.
formatting is not necessary at all.

KK>Someone gave me the web address, but I can't seem to access it. And I
KK>no longer have the address in my mail box.
There you may find a demo that may allow only one partition.

KK>Does anyone know if HDDriver will support a Syjet 1.5 GB External
KK>removable?
Yeah, why not?

KK>Do they make an adapter from DB50 to Centronics?
Yes, they do.

KK>I have other SCSI devices.
Ok, so there are only two things you shoud pay attention to:
Termination at _both_ ends of the bus (and nowhere else) and no device
must have the ID of another!!

KK>I have an 80MB IDE in the Falcon. I was thinking of installing a
KK>Toshiba. Will it take a 2.1 Gig, or is that too much for the Falcon to
KK>handle?
I think TOS 4.0x won't have any problems with that.

Hi Charles,
I believe there is a problem with long addresses in Newsie .94 (I'll be
corrected If not). I get around it by entering only the first portion of the
address and proceed as follows:

Server chapalie.rma.ac.be
Logon anonymous
Password (leave blank)
Port (leave blank)

You get a list including 'Atari' which you click on.
and continue clicking on the succeeding portions of the whole address to the
file wanted. Works for me!

Hi Rich,

R>1. I have an atari HD enclosure without a drive, This is supposed to
R>be for a 52MB drive. Does anyone have a used drive for this unit they
R>are willing to sell, or at least know what type of mech went into it.
which host adapter is enclosed in that box, if any? SCSI<->ACSI or a
really old fashioned MFM (RLL) <-> ACSI?

R>2. I would like to get the 1040 online but I don't know if there is a
R>good tcp/ip stack out there or a PPP protocol package and maybe a
R>browser of soem kind. Please let me know if you have any suggestions.
I wouldn't do so! Even my TT is a bit too slow for real surfing on the
web, and a 1040 will be 4 times as slow if its hardware had not been
accelerated. Furthermore, black and white? I recommend a PC for such
purpose.

R>3. Does anyone have a list of the TOS error codes, one of the programs
R>I need most keeps giving me a TOS error 35 when I try to load the
R>program (Word Writer ST).
'35' means (if I'm not wrong) that an executable file is _not_
executable, most probably the file was corrupted when copied from
somewhere else.

R>Thanks and please reply by email since I don't watch the NGs that much
R>swolfen@mediaone.net
Sorry, but I think a public question deserves a public answer. For
maybe there are more people who share your problems and appreciate
solutions. :-)

The correct address is:

http://home.nikocity.de/nogfradelt/atari_english.html

> First I'd like to try a demo. Then I'd like to know where I can
> obtain program and manual in english and what the fee is.

You can download the demo from the address above. HDDRIVER with an
English manual is distributed by System Solutions.

> Does anyone know if HDDriver will support a Syjet 1.5 GB External
> removable?

Yes, it will. HDDRIVER supports any drive that can be connected to the
Atari.

> I have an 80MB IDE in the Falcon. I was thinking of installing a
> Toshiba. Will it take a 2.1 Gig, or is that too much for the Falcon
> to handle?

With HDDRIVER there is no upper limit for a drive's capacity. The only
limit is the maximum partition size of 1 GByte with TOS 4.0x. That's a
limit imposed by TOS, not by the driver. With MagiC and MiNT and FAT32
or EXT2FS partitions you can have much larger partitions.

>
> What is the limit for hard disk sizes on the atari? I know Tos 1.00 and 1.02
> had lowley limits but what about Tos 4 etc?

There is no limit at all for a drive's capacity. Only the partition
sizes are limited by TOS. TOS 1.0x supports partitions up to 256 MByte,
TOS 2.0x/3.0x up to 512 MByte, TOS 4.0x up to 1 GByte. With MagiC or
MiNT installed there are other partition types like FAT32 and EXT2FS
that virtually have no upper limit at all.

Hi folks

I have been out of the atari world for a few years while playing with PCs but I just couldn't stay away. I just got a few old STs from ebay and have a few questions for the group.

1. I have an atari HD enclosure without a drive, This is supposed to be for a 52MB drive. Does anyone have a used drive for this unit they are willing to sell, or at least know what type of mech went into it.

2. I would like to get the 1040 online but I don't know if there is a good tcp/ip stack out there or a PPP protocol package and maybe a browser of soem kind. Please let me know if you have any suggestions.

3. Does anyone have a list of the TOS error codes, one of the programs I need most keeps giving me a TOS error 35 when I try to load the program (Word Writer ST).

Thanks and please reply by email since I don't watch the NGs that much
swolfen@mediaone.net

Thanks again

The safe limit at TOS4 is 1GB/partition. I personally have some 2GB
partitions and did not notice any problems until now.
Old drivers, in fact I think every driver except the latest version of
HDDRIVER, support only up to 8GB/HD. At least I found nothing else than
HDDRIVER that fully supports my 20GB IDE HD.

Gerhard

```
Well, the thing is, I've never seen this socket used on anything else than
an atari. The Conrad catalogue definitely lists it as an Atari 13 pin DIN,
and I'm not sure if the DIN standard does actually list the 13pin flavour.

```
The RF circuitry was only on the STFM (remember, F for Floppy, M for
Modulator), and then on the STE and Falcon. It was also left out in
countries that use the SCART standard, because this gives standard TVs the
RGB inputs.

> HDDRIVER that fully supports my 20GB IDE HD.

For SCSI drives HDDRIVER has supported this for many years. IDE drives
larger than 8 GByte require a special addressing mode (LBA) which is
only supported in the more recent versions of HDDRIVER.

Are you sure it was a 52Mb drive. What's on the box. Some of the SH204
drives are upgradeable to SCSI. The Megafiles are not, except the Megafile
66 which is a Syquest unit.

Yes, this is in the FAQ.

It doesn't mean much to the average user (something like stack overflow or
parity error). What it does mean is that the file or disk is corrupt.

6084. SMURF image convertor and processor (English version)

Newsgroup: comp.sys.atari.st
Date: 2000-05-22 00:00:00 UTC
From: System Solutions <sales@system-solutions.co.uk>
Message-ID: <8gb7b6jlg1@lure.pipex.net>
Source record: 61873

Dear Atari user,

The Smurfs have landed. Need to use an image in some
obscure format? Smurf, from Therapy Seriouz Software,
is probably the answer. This extremely fast
graphic convertor includes 73 import and 18 export
modules. It is also a superb creative tool thanks to
its modular expandable image processing facility.
Over 40 image filters (including motion blur, high
quality single-degree precision rotation with optional
anti-aliasing) are provided with the package. You will
have many, many hours of artistic fun with this one!

System requirements:
Any Atari or compatible 16bit and up (minimum Atari ST,
1MB RAM, Floppy Disk, SM124)

Recommended: Atari compatible with 16MHz MC68030 or higher
colour graphics card, colour monitor 4MB RAM Hard disk.

Look sharp, for £39.95

Check http://www.system-solutions.co.uk for more
details, or call our sales team on 01344 890008.

Your System Solutions team

Imagine my surprise when I found this connector in my car
stereo, some years ago. It was a Clarion I think, and the car
was a Volvo. If I remember it correctly the 13p was used for
power supply to the stereo.

The eightbit times were a pain when it came to odd standards,
odd ports and incompatibility in general.

The odd connector prize all times must however go to the
Sinclair QL and it's completely impossible-to-find modem
(serial) connector. Let's hope this all is behind us now...

I have had this information save for a while.

While installing NVDI 5, the program will ask you to select any
installed cards and yes with Nova, NVDI will switch off the screen
drivers by renaming them SYS to SYX ...

But of course you can continue to use the other NVDI functionnalities
like Speedo, TTF and now Postcript fonts and above all printing with
the latest printers drivers available on the market ... there is a
long list for them ... let's have a look at Behne and Behne web page:
http://home.t-online.de/home/ToBeHome/homepage.html

JAR025.PRG Allows me to switch to Geneva easily.
EMULATOR.PRG NOVA
MENU.PRG NOVA
STA_VDI.PRG NOVA
XBOOT.PRG
MAGXBO32.PRG Magic memory protection (a good idea)
MAGTOROM.PRG Magic Loader
...

Good Luck!
```

NVDI6??? AFAIK the latest version is NVDI 5.03 or am I missing something

I do have a Mach 64 4MB Card on my Hades and I regret I bought that card.
In fact the card is good but not the driver novaVDI 2.67. Especialy with
Cab I have very annoying problems caused by the driver. When Cab displays
animated gif's my harddisk is spinning. When the picture is heavily
animated it's almost impossible to scroll down the text.
I know I can patch that driver but then the animated gifs looks rather awfull.
I don't know if that problem also occurs with MagiC but it surely occurs
under MiNT.

Would you say that the ST was ever seriously considered
as a business machine in the USA? I get the impression that in Europe (perhaps
Germany in particular) they were. I wonder if the high-res mono monitor had
anything to do with that.

GG> At times, though I have noticed that the idea of high
> end usually tends to be a MegaST sometimes a TT.

I think an ATW probably counts ;o)

GG> And if you run into a midi musician, a Falcon. :)

I thought the Falcon excelled at sampled audio (thanks
to the very sensible inclusion of a DSP). Were users of conventional MIDI gear
attracted by its extra horse-power?

GG> So where ats on this side of the pond do you reside?

Currently in Atariville, Illinois.

It's not MiNT-related, it's a memory-leak in the offscreen bitmap
functions. I'd suggest you patch the driver, or try fVDI (don't know if it
works on the Hades).

I have heard numerous stories of the Atari 8-bit used as terminals for
early networks. The ST has been used in many studios, and I believe I've heard
of a high school or two that might have used them for a while.
The most recent stories I've caught wind of are TT computers. There is
talk about how some of them would be used for reference machines in car repair
and estimation bays.
Data Stitch was a business that used a modified Atari TT for their large
looms. According to what I heard, one could operate several. They would have
kept using the TT for years longer but Atari couldn't supply them enough TT's
as fast as they needed them. They sold off their inventory, and the local
Atari users of AUNT bought them and found themselves with a cheap source of
TT's.
Also heard of Atari TT computers being used at Marvel Comics.
And Falcons have found uses both in and out of the music industry.

>> At times, though I have noticed that the idea of high
>> end usually tends to be a MegaST sometimes a TT.
> I think an ATW probably counts ;o)

Were there many ATW used in the States? I've heard of one being sold at a
first Saturday sidewalk sale, but that's about it.

>> And if you run into a midi musician, a Falcon. :)
> I thought the Falcon excelled at sampled audio (thanks

Oh they were attracted by it's ease of setup, it's ease of startup, less
overheard... blah.. blah.. blah...

6104. ove You Virus" story... ST To The Rescue! - Part I

Newsgroup: comp.sys.atari.st
Date: 2000-05-22 00:00:00 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0001.3929c67d@fmlynet.org>
Source record: 61893

FamilyNet HQ: Telnet:\\www.family-bbs.net

It was early on a Thursday morning when I was greeted by a friendly
little message with the heading of "I Love You". And from that message it
simply said "Please open the attached message from me."

This was in my business E-mail box at work, and I found myself curious
who would send me a love letter, especially since I'm married. ;)

I clicked on the odd file, and my PC came back saying "I don't recoginize
the application that wrote this file. Please go down to the Start menu to
select the proper application." With even more curiousity I was about to save
this file from my Outlook box to my hard drive when I realized (perhaps a
little quicker than those who opened several of these love letters) that this
file could be a virus.
Within the hour our network server was down due to hundreds of letters
replicated within our server due to the love letters. Truly a nasty site. At
first I believe I was uneffected, but then I was not sure.

Before leaving work, I disconnected my PC from the lan to do some more
research on my ever faithful PC (that has led to me mainly hours of internet
surfing looking for Atari websites and newsgroups). With a little more
thought, I would try to find out for sure if I had been bitten by the love bug.

When I visited my parent's house, the word was out, love was in the air,
and thousands of computers had been ravaged throughout the world. I heard that
England was hit hard, with the house of Common's E-mail server down completely,
and throughout the world the effect was the same. There was no known cure for
this bug for a good bit, and people were not sure when it would end.

So then it hit me... since I need a computer to hold up the work load at
work, while I investigate my PC? Why not bring in a computer that could care
less about PC viruses? And it would make for a fun tale down the road.

It was then I decided....

... I was going to let my Atari 1040 ST (with AdSpeed) take over for one
day at work!!!

To Be Continued....

It's great to get this news regularly, but can anyone tell me just how to get on to the site and download stuff, please? Lately I cannot reach the 'store' of files, but I have a wonderful time exploring this quite interesting Uni site. There seems to be no connexion from the htm pages to ftp. (CAB 2.7; Newsie.94 won't even touch it).

Charles.

This is not true. Some original 520 STs came with RF out. I have 2 of them.
One is a original ST with TOS on disk and the other has ROMS.

Ooooer! I've had a poke around in the docs. but can't find that. Perhaps one of the FAQs will have it. All I can say is that hsync doesn't usually cause any problem.

This is not the limitation imposed by the demo. The README included in the demo archive contains information about the limitations of the demo version.

> I think TOS 4.0x won't have any problems with that.

The version of TOS doesn't matter here. It's the driver that's responsible for addressing a drive with it's full capacity, not the version of TOS. TOS has an influence on the maximum partition size as long as you don't use FAT32 or EXT2FS partitions.

I'm very confused! Do you mean that you've typed ftp:// etc into CAB's Open
URL line and can't get a response? Perhaps you need to install an FTP client
in CAB. If you're running MagiC or MiNT then I recommend aFTP. Be aware that
some filenames on the Chapelie server have long filenames.

CAB 2.7 seems to display animated GIF's from the hard drive; the reason for the drive spinning. I don't think that CAB 2.5 did this. With CAB 2.5 it was almost impossible to scroll down on sites with lots of animated graphics. It's quite a bit better with CAB 2.7 using NVDI 5.03 and MagiC 6. The Nova is great and wouldn't use my computer without it.

I use a Nova VME Plus card with the 2.60 driver on a TT and a 17 inch NEC MultiSync 70 monitor. Animated GIF's look great; actually all graphics look great. I use a 800x600 32k color window.

A hopefully not too longish question from someone who has limited knowledge about what the jargon actually means. By trade I am a musician which means A) I know not too much about computers and B) I am not excessively rich. So, whilst working on a four part harmony piece on my 1040 st running my notator software, and happily humming away to myself, in the knowledge that I would soon be finished. I was assailed by a large zap! and bang as my monitor bit the dust, which, after much buzzing and frazzing ended in that great monitor graveyard in the sky. To cut a long story short I have heard a rumour from a friend who suffered the same indignity that your standard monochrome vga monitor will happily do the job given that the 13 point din plug is wired into it. I have recourse to said monitors and a technician who is willing to do the job, (if it's not more trouble than it's worth.) My question is, for those who know (and hopefully don't consider it sacreligious) is this operation on a scale of one to ten. 1- A piece of the proverbial, as we Ozzies are wont to say or 10- a complete bitch? Have I been informed correctly or is there more that needs doing? is it even the correct monitor? The reason I don't go out immediately and buy another old atari monitor, well there's two really one is my eyesight is not that good and the little monitor played merry hell with my sight and two is that I have access to the said alternative monitor. Well so much for cutting it short, but, I'd be much obliged if some true blue bonza digger bastard (that's for all you wonderful guys elsewhere than Oz.) would give the drum on this issue. Beauty, bonza, bottler,digger. And thanks cobber too! Fair dinkum your alright mate!!!

I noticed this from jayoni-one-spagoni, and it made me think:
::::}A hopefully not too longish question...

You hoped wrong.

Are you aware that atari St's (Australia esp.) can have RF out?
(That is you can plug it in to the telly?)
All of mine do, I've got 3 1040's & 2 520's, all with RF out.

The other thing you can do (since you have a techo mate who can solder)
is, since the output of the atari is just RGB in a f**ked up arrangement,
cut off the cable from yer old monitor and wire it to any old RGB monitor
lying about, like an amiga 1084s or similar, if it 10 or 15 years old, is
color, has nine pins and looks like a 1084s, it'll do the job.

It's not the most elegant departure for yer old SM124, but it will get
you going again.

Ed, did you order direct fro ROM or from a US source? And did you order
the office version or just the word processor?

Did you try the demo, and what did you think of it?

...which is useless for sequencing I'm afraid. I'm not aware of any
sequencer that will cope with colour resolutions. Also, only the STFM and
STE flavours have RF out.

Again, RGB is useless for our friend. He wants a mono monitor.

You are right. A VGA monitor can be used as a monchrome monitor. You can
actually buy the VGA adapter from Mario Becroft in New Zealand. This all
detailed in the Quick FAQ (see .sig).

I use HDdriver 7.71, and it seems to work fine on my SyJet 1.5GB
cartridge.
I partition for DOS, so the entire cartridge is one partition of 1.5GB.

> I Think the Syjet is DB50 to DB50. Do they make an adapter

My SyJet drive came with a SCSI2 cable, which plugged into my Falcon
no problem. the input and output on the SyJet is SCSI2 and I just
connected
my external hard drives via my original SCSI2 to the back of the SyJet.
All seems OK.

>
>Damned ! I thought it was a "feature" of Cab 2.8.

No, it isn't a feature of Cab 2.8 at all. Like Jo-Even has said, it's a
driver bug.
One can patch the driver or Cab.
If you patch the driver it's possible that some programs won't start
anymore because they look for the EdDI cookie, which isn't set by the
patched driver (right Jo-Even?).
I only encountered one program but I can't remember for sure the name
right now. I think it's the German graphical program called Bellini.
When the driver or Cab is patched one will notice some strange display
effects in Cab. e.g. <blink> </blink>. When this is set inside a colored
table the backgroundcolor of the page will bleach trough.
Also (some) animated gifs will be diplayed rather flickering (hm is this
a English word?).

Patching is really dead easy. Just load sta_vdi or cab.app as binairy into
Qed and search for the entries EdDI (one in sta_vdi and two in Cab) and
replace this by something else, for instance EdDX.

I'm confused too. Charles says he can explore the site but he can't
download the stuff????

My experience says that one must use a proxy server when one want to
access a ftp-server with Cab (without ftp-client). At least that's what
I've to do on my Hades running FreeMiNT/N_AES. It doesn't matter if I use
MiNT-net or STing/STik.
For MiNT-net you must fill in something like this (the proxy of my ISP):
HTTP-Proxy
http://proxy.antw.online.be:80

For STing/STik you must use this:
HTTP-Proxy
proxy.antw.online.be:80

Furthermore you really must use the latest version of STing (1.22 I
believe). With older version some, even with aFTP can't access the Belgian
server. In fact that's not the fault of STing but rather the fault of
Belnet. On host just outside the RMA is misconfigurated. The people of
Belnet knows it but as only Atari seems to be affected they aren't very
keen to fix it.

We have recieved a few reports of Iconnect-users who seems to have
troubles too, but OTOH I do know lots of Iconnect-users who hasn't any
problem whatsoever to access the server.
The only TCP/IP stack I know which never has had any problem is Mint-net.

Newsie should work, at least it does connect to the server but (my fault)
I'm unable to switch dir's and so on.

No, that's really the fault of the driver.
Cab 2.5, Cab 2.7 and Cab 2.8 do have this problem but not Cab 1.5
Agree the Nova could be great if the driver was good.
>
>I use a Nova VME Plus card with the 2.60 driver on a TT and a 17 inch NEC
>MultiSync 70 monitor. Animated GIF's look great; actually all graphics look
>great. I use a 800x600 32k color window.

The latest driver is 2.7.
I just wonder if you use auto/sta_vdi.inf

Until recently I wasn't using that info file at all, just
auto/sta_vdi.bib.
Now without that sta_vdi.inf I found that for instance inside Photoline
the mouse was behaving very slow when I moved it above a picture. Very
annoying. Especially in 32b colormode this was really a nuissance.

Inside sta_vdi.inf one can set a few things like for instance cursor
behaviour

; Bei den mach32/64 Karten wird ein Hardwarecursor eingesetzt.
; Dieser mui¿½ bei Bildschirmausgaben nicht, wie ein Softwarecursor
; ausgeschaltet werden. OFF = Cusor li¿½i¿½t sich nicht auschalten,
; ON = ATARI i¿½blich
HW-MOUSE-OFF=OFF

I don't know what hardwarecursor and software cursor are but as you see
I've switch the hardware cursor off.

Now with this setting the mouse behave as expected.

So far I haven't encountered (or don't recognised it as) problems with this setting.

BTW: Paul Williamson, if you reading this, there is also an option to swicth off permantly the novaVDI screensaver. I know at the time you were using a nova card on your Hades you had problems to run Cubase. I wonder if you were using that inf or not? If not that could explain why the screensaver was poping up even if you'd switch off the saver in the cpx.

>or isn't it as simple as that?

AFAIK, only (some) animated gifs but I can be wrong.
You can patch Cab. Just load cab.app into a binairy editor such as Qed and
search/replace EdDI by EdDX. The are only two such entries in Cab.

If you want to see how slow things can come go to:

http://www.ndh.net/home/kehr/atari/Atari.htm

That page holds lots of animated buttoms, at least that's what Papillon
says about these gif when loaded into Papillon. They doesn't do any
animation inside Cab but they makes the HD spinning as hell, which makes
it almost impossible to scroll down the page.

Hi Folks...
I've got proiblems with FTP ATM. I'm using Newasie 0.94 via STING 1.12 with dialler 1.15 under TOS4.04 on a 14Mb Nemesis-Eclipse (1280 x 1024 x 16 bit) Falcon. Basically I've been trying to get to teh Belgian FTP site and I can't do it....tried chapelie, tried ftp.chapelie (with all the other gubbins.ac.be etc)_ also tried the numeric string can't get in, the connection jyust times out.
I'm using <anonymous> as a login, and my email as a password...port 21 what else is there...any ideas?

chrisc

>with other exploding on contact!.
>
Yes, this is what I use too Steve - works great here. By the way version
1.26 is out now from: http://home.datacomm.ch/donze/ in case you don't
have it.

>Just a further thought re your prob, try switching the blitter off?
>
As I use NVDI it's never actually on (is it compatible?) and also because
I have RSVE with HSMODEM 7 as I remember it recommends not to use it with
that either. Thanks anyway though Steve for the suggestions.

Hello everyone,

Small question about the HSMODEM suite and ASH. I've noticed that with
all my ASH Internet software they include HSMODEM 6 not 7 for some reason
- this includes some recently bought software too.
Does anyone know the reason for this? I use 7 with RSVE and as far as I'm
aware not had any problems with it so was wondering why ASH distribute
version 6 with it's software.

Thanks in advance.

No Falcon here, just an STe but exactly the same problems. So can't
be anything to do with your Falcon.

>Basically I've been trying to get to teh Belgian FTP site and I

Done the same thing tried IP address instead like you but the
connection times out. I can ping and resolve it using Sting.

Been using exactly the same setup as you. As soon as the site was
advertised about a month back I put a post up like this saying very
similar things. Got a good response but still nothing.
Sounds like a good site.

From: sean@grrr.co.uk
Message-ID: <8F3DEFD8Aseanjuro@130.133.1.4>
Source record: 61839

Hello all,

I have recently fixed up my old 520STfm (it had the controller port loosening problem, a liberal applying of solder sorted that out) and am taking my uncle's 4Mb STe in a couple of days (hopefully, he doesn't want it) and I have a few queries..

1. Can I connect the STs by simply using the Null-modem cable I use for my [spit] PCs? Or do I need a special cable? I have a 5 metre null-modem with both 9 and 24 pins at each end.

2. Is there any way to use one of my PCs to act as a "server"(connected to the 'net), connect an ST up with the cable and make it the "client" to allow it to email, usenet and/or browse the web (even with no graphics)?

Sorry if they sound dumb questions or have been answered elsewhere, I am just excited to get another ST.

I have never had that problem under Magic or Geneva, but then I never
really looked at my hard drive (much) while I was online. From what I
could see, things were quiet.

Anyway, when the "spining" can be a problem (ie. when downloading), I
just click on the Stop icon.

Btw, where is the last version of the driver available ? I have v2.67.

Bye,

It was available as a disc-based OS for the first STs, but was in ROM
for the early STFs & STFMs. My first STFM, bought in 1987, had TOS 1.00
in ROM.

Rich,

The Supra had a couple of different versions of their SCSI controller. If I remember correctly one of the versions doesnt like drives other than the size it was made for. The Supra controller card is SCSI. Your best bet would to find a used 50meg SCSI hard drive.

1.4005 was a binary 68030 only version. I had put it up for a few
people to test. But then I discovered that it had worked its way out onto
other sites. So when I finished up a new version I made it 1.4006, so
that it would not be confused with the inadvertently released 1.4005.

The HDD cabinet is a Supra drive 52MB missing the mech, I can't tell what kind of controller is in it. looks like it may be MFM or scsi. I basically just want to get the ST online to download files with it, transferring files is a pain in the butt. The disk in question giving me the 35 error is an original disk for Timeworks Word Writer ST I bought on Ebay. It was part of a batch of software. And the one title I really needed so I could access some old files I needed on old atari disks.

Am using a Mach 64 with a TT and Nova driver 2.66 on my TT and MagiC 6 with no problems. IIRC there were memory leakage problems with one of the earlier drivers (2.61 or so) that was needed if one was using NVDI. The current problem seems to be Hades specific. I have a collection of older drivers if anyone wants to try them.

Hi all,

Is there anybody in sweden who would like to buy a Falc?

16Mb RAM
850MB Internal HDD
ScreenBlaster II

Could also include a SCSI CD-ROM and some software!

Send me a email if somebody is interested..

/Freddie

This is news to most of us. If it has an RF Modulator, it should be an
"STM".

In general I don't have any problems accessing Chapelie with an IConnect
conection and Fiffi FWIW.

Some ISPs don't have proxy servers, so (I don't know if this is an issue or
not) anyone using STinG must be aware that using different dial scripts to
access more than one ISP might result in another ISP's proxy server being used.
I moved all these ISP specific settings from default.cfg to the dial.scr file
to cover this eventuality, not that I use STinG now.

>both 9 and 24 pins at each end.

Yes. You'll use the 24 pin connectors. Recommend that you install the HSmodem
patch for the serial ports on both machines.

>2. Is there any way to use one of my PCs to act as a "server"(connected to
>the 'net), connect an ST up with the cable and make it the "client" to
>allow it to email, usenet and/or browse the web (even with no graphics)?

Yes. Download STinG from http://sting.atari.org for starters (the serial.cpx
for setting your serial ports itself is worth the download), I don't know how
you set it all up, but you need "masquerading".

That's IP masquerading, and it can be done with STinG. Why not connect the
ST directly to the net with the modem?

Hi Sean.
If I remember rightly, try the two modems connections method.
Then with the software (PD) DUET.ACC in each other setup. There
shouldn't be any problem. The only other way to get both ST'S linked to
the PC is to use the MIDI port method with a Modem free for the
connection to the PC.

6169. Anyone use Oasis?

Newsgroup: comp.sys.atari.st
Date: 2000-05-24 00:00:00 UTC
From: sonik@freedomnames.co.uk
Message-ID: <8gge6knmm1@news.minx.net.uk>
Source record: 61763

Hi folks

Does anyone here use Oasis? I've just come across it on an old PD disk and attempted to install it but it seems reluctant to run. I made sure it had plenty of HD space but after double-clicking on the main PRG it just stops and that's it. I did run the Install prg and bunged in my details and that was ok, but after that it was hasta la vista baby so any ideas and tips would be welcome.

For the record, I'm running a STE 1040 2 mb with a 120 mb hard drive. Is Oasis/NOS actually worth having in these days of Newsie and CAB or is it just an anachronism?!

Cheers for any info :)
Al
sonik@freedomnames.co.uk

ps I too have been having problems with Newsie resolving to the Belgian FTP site - what's going on there? Also does anyone know if Little Green Footballs software has a website?

There not a STM. They just plain STs. The cases are original. I know this
because I broken the original factory seal. On the back it even says
Television.

>I'm using <anonymous> as a login, and my email as a password...port 21 what
>else is there...any ideas?

I've told this already many times before, _please use STing 1.22_. Due a configuration fault just outside the RMA some people are unable to access the RMA. The people of Belnet knows what is wrong but as only Atari is affected these seems not to be in a hurry to fix it.

As we first thought it was a STing problem we contacted the Sting author. With the help of him, Bruno Kozlowski and many others we discovered the problem. The author of STing in casu Ronald Andersson was so kind to adapt STing. With version 1.22 one should be able to access the server, even with Newsie but I really can't recommend it. You should better use a proper ftp-client such as aFTP, MGftp, Gaftp.

As address in Newsie you must use "chapelie.rma.ac.be" and not 'ftp.chapelie.rma.ac.be' or 'ftp://chapelie.rma.ac.be'. The latter must be used with a browser.

I use ftp://chapelie.rma.ac.be in my weekly update news because some people has asked me to do so. The most good (Atari)mailers are nowadays capable to call the browser if one click on such an address. Adding such an address in the weekly update news is thus very handy.

HTH,
Martin

>similar things. Got a good response but still nothing.
>Sounds like a good site.

Anonymous and a valable e-mail address is right.

Are you using STing v1.22? If not please try it with that version. It
should work.
Furthermore have you tried it with another ftp-client then Newsie? If I
read the post it seems that only Newsie user has problems.

A possible solution: Use Cab own ftp-routines with the proxyserver of your
ISP

As proxy setting in Cab set this. It's the proxyserver of my ISP so you
should replace it with yours:

For HTTP-PROXY
proxy.antw.online.be:80

You don't need to fill in the other proxies

Stop buttom???? Euch I though if one click on that buttom the downloading
stops also, or are you meaning that one can press the stop buttom if one
downloads stuff with a ftp-client?
If so, iconify helps also.
>
>Btw, where is the last version of the driver available ? I have v2.67.

2.67 is AFAIK the latest one.

Do you mean that even with a pc you can't access the Belgian ftp-server?

That's is really weird. We never have received any complaints from pc/Mac
users.

What day/time have you tried to log in?

Remember it's a school with lots of students who stay there the whole
week. At some moments due the heavy use of the server by the students
things can go slow.

Also remember anonymous access is restricted to 20 users at the same time.

If you means that Gehard has fixed the memory comsumptions. Yes that has
been solved. With older version of sta_vdi my system ran out of memory
after a certain time when Cab for instance displayed an animated gif or
when the screensaver was working.
This doesn't occur anymore.
My problem is that the Harddisk is doing something as long as Cab displays
an animated gif. In certain circumstances the HD is spinning so hard that
it's almost impossible to do something else.

However I just discovered that without NVDI 5.03 my HD isn't spinning
anymore.

I must say that I'm very pleased with mine. I'm using the absolute latest
Falcon-driver though, I don't know if it differs from you Hades-driver.

> I've switch the hardware cursor off.

"Hardware cursor" means that the mouse is actually a sprite that's handled
by hardware. "HW-MOUSE-OFF=OFF" means that the VDI can't hide the cursor,
this removes the small flickering you'll otherwise notice as the
background is redrawn.

I'd recommend switching off that screensaver anyway, and use Clocky
instead. Clocky supports VESA powersaving on the Nova as well, so it will
actually power down your monitor instead of just displaying a blank image.

Yep. Hand wiring MAY work as well (wire all color lines
together and activate the monochrome detect pin), but note that
the ST puts out 1V while the VGA monitor is expecting 0.7V.
Although many monitors handle it fine, I seem to recall reading
that Mario's adapter adapts the voltage as well. At around
$25US, there really isn't any reason not to go with Mario's
device.

http://gem.win.co.nz/mario/hardware/ will take you there.

6188. 2 Alternative Party -- Event for computers with personality

Newsgroup: comp.sys.atari.st
Date: 2000-05-24 00:00:00 UTC
From: Kristoffer Lawson <setok@fishpool.com>
Message-ID: <8ghg7i$6r7$7@news.bbnetworks.net>
Source record: 61782

As before, Atari should have a strong presence at this weird party. So
see you all there..

2 Alternative Party ... Computer Party ... or something

This is a supremely official advertisement about the rebel of all computer
parties, the 2 Alternative Party. Are you tired of the boring conformists who
spend all their precious youth at mindbogglingly mainstream computing events?
Events which don't even deserve to use the term "party"? Events where
machines with personality are oppressed beyond all recognition and without
glory?
The 2 Alternative Party is a venemous strike against the majority. Where
devoted users can take part, whether they own a Spectrum, MSX, Altair, Cray
or any other weird and wonderful combination of chips. Nothing about
the party is normal. Nothing would be shown on Top of the Pops. It wouldn't
even be allowed to appear on Fashion TV during an advertisement break as a
tiny subliminal message with the picture distorted.
Unique competitions will be organized, including: ST-01 Music Competition,
Obscure Music Competition, Source Code Graphics Competition, Obscure Machine
Competition and the highlight of the party: the all-machine Demo Competition.
If you feel different -- special even -- mark the dates 7th July to 9th July
into your calendar brain implant. Then add a note to be in Helsinki, Finland
at that time and finally burn the text "2 Alternative Party" into your neural
pathways with big, friendly, pink letters.

For more information:

WWW: http://www.fishpool.com/alternative-party/
EMail: Kristoffer Lawson (Setok/Aggression), setok@fishpool.com

PS. You may pass this on to friends.

Almost certainly SCSI 50 pin (do you see a 50 pin connector?).
Get a nice used drive from Ebay in the Macintosh area.

>2. I would like to get the 1040 online but I don't know if
there is a good

>
For free, get STing 1.22 as your stack and CAB 1.5 as the
browser. I recommend MyMail for email and Newsie for newsgroups
and FTPing. Monochrome surfing over a 19.2 connection isn't
fantastic, but it gets the job done.

>3. Does anyone have a list of the TOS error codes, one of the
programs I
>need most keeps giving me a TOS error 35 when I try to load the
program
>(Word Writer ST).
I don't have a list of error codes either, but 35 usually refers
to an executable that isn't. It can also occur when part of the
executing process involves writing to disk on a locked disk (I
get it a lot on CD-ROMs). Try copying Word Writer to an
unlocked floppy and trying again. If that doesn't work, your
program file was probably bad.

>Thanks and please reply by email since I don't watch the NGs
that much

No I am not. At least today I got on a website with an animated gif and
my hard drive was silent and I was able to scroll with no problems.
This is under Magic and i do not remember this happening under Geneva.

Absolutely :-)
My choice is to use GapFTP with Okami (and STinG 1.22): very quick.

An occasion to thank you publicly for Chapelie/atari and to carry on
with the UTSI.

At least with cabdload module, not with just a click on an url.

> If so, iconify helps also.

Yes :-)

Thanks for the Inet suggestions, Im trying to get a HDD mech. The enclosure is actually a Supra enclosure with Power Supply and SCSI board inside, no mech though. Another user said the card in there should be able to handle any scsi drive, althopugh Im worried about partitioning since it's only 1.04 TOS on an older 1040ST. The drive cabinet has two connectors, oen looks like a standard rs232 and the other is a 19pin like a PC joyustick jack. Im assuming this is the atari weird drive cable connector. Ill have to see about pinouts or something so I canmake a cable for it since I can't seem to findone on Ebay.

Hi Martin,

I don't use the file "sta_vdi.inf". I'm using "sta_vdi.bib". AFAIK, the
2.60 driver doesn't use the .inf file. I've been using the same setup for
the Nova ever since I first installed it in 1993 or 1994 on my Mega STe.
When I started using the TT, I just moved the graphics card and hard drive to
the TT.

The objective is to allow more than one machine to communicate
with another network through a common IP address (unique network
identifier), by the principle of translating private addresses
(those of the clients in your local network) to that of the host.
Hence, IP masquerading. As far as the remote server is concerned,
it's still dealing with a single client.

Apart from that, I deny all knowledge of networking so I don't
know how to set it up either.

Message-ID: <9s2X4.5616$Ls1.782777@typhoon.mw.mediaone.net>
Source record: 61704

Hi

I have an Atari Supra drive enclosure, due to some very helpful members of the group, I have been able to determine that the scsi card in it can work with most scsi drives so I have a bid on an 80MB on ebay at this time. A few questions for anyone who may have worked with these drives.

1. I don't see a power lead for the drive coming off of the enclosure's power or scsi card, how do you power the mech.

2. what will I need for software to format it?

I do see a bank of pins on the scsi card which don't seem to go anywhere, could this be the power connector? It seems to be meant for a small ribbon connector.

All help appreciated

On a different note. Im trying to move some software I downloaded from the PC to my ST. I grabbed makedisk in order to make some st disks from the disk images, but it asks me to reformat the 720K floppies (I am using DSDD disks) and it errors on each one with bad secotr errors. These disks are fine and brand new so I dont thin it is the floppies, any suggestions?

Since he wants to use the PC as the gateway, he doesn't need
IP-masquerading on his ST. However, he needs it on the PC and AFAIK
Windows does not support it out of the box so he needs additional
software.

These are easily available from Atari dealers and toner suppliers under
Atari and other brands such as Laserpro which also used the TEC engine.

>newsgroup section. Please email me at cheok@pacific.net.sg.
>
>Thanks
>
>Danny

You can without problems use toner for the TEC LB 1301. This is the same
toner cartridge as originally used in the Atari SLM 804 laser printer.

The same is true for the OPC-kit, ask for TEC LB 1301!

Thanks - not such an easy project after all.

TBH, if he's going to be using the PC to access the net then he might as well use
its browser etc, and use sneaker net for any file transfers.

You can use Videlity with the SB hardware, it's rather easier to set up than the
official SB stuff IMV. Videlity is now PD, I'm afraid that I don't have a URL.

6219. Atari Computing Magazine Sale- final call!

Newsgroup: comp.sys.atari.st
Date: 2000-05-25 00:00:00 UTC
From: publish@welshnet.co.uk
Message-ID: <392d116e.3041710@news.cis.dfn.de>
Source record: 61715

OFFICIAL AC FINAL CLEARANCE SALE

We need the space for other stuff so we are completely clearing all remaining stocks of AC magazine, and are offering them for sale at just 1.00 UKP each including UK postage!!! (basically that's little more than the cost of P&P). Matching Reader Disks for each issue are also available at 50p each, or get all the RD content on the Time.Capsule CD-ROM at just 1.00 UKP!

Surely the bargain of the year!

Atari Computing was the well respected A4 printed magazine which ran to 16 issues over a three-year period, finally closing at the end of last year. The magazines built up into a library of useful articles, reviews and tutorials and remain an important part of Atari history.

If you order five copies or more we will throw in the Time.Capsule CD-ROM free of charge, or you can buy it on its own at just 1.00 UKP. It features AC articles and software as well as three excellent music tracks performed by Mark Wherry.

AC issues still available are everything apart from 1-3, 5 & 8.

This offer will close on 1st June and all remaining stocks of the magazine and disks/CD-ROMS will go into incredibly deep storage!!!

For full ordering details, and to check availability of certain issues (some are almost sold out) please email me at the following address:

publish@welshnet.co.uk

Non UK orders are welcome although postage will have to be charged at cost.

All orders dealt with on a first come-first served basis, so please don't delay.

The sale really does have to end on the 1st June!

Cheers
Mike Kerslake

Best wishes
Mike Kerslake

Hi,

I have finally got my hands on a Mega 4 and it is nice to have an ST again, 6 years in the world of PC's et al have made me miss the old machine.

Rambling aside I need to get my hands on a nice Hi Res monitor pres an SM125 but a 124 would be fine, does anyone have one that they would consider selling?

I am based near Manchester but can collect witin a reasonable distance or pay carriage from elsewhere.

Please drop me a line

Julian

Hi,

The monogrome monitor of my Atari Mega STE has passed away. I would like to try to connect a spair PC multisync monitor but I don't know how. I'm kind of hoping that this monitor will be able to show low, medium and high resolution. Is there a special connector needed, do I need extra software? And just as important where can I get these things (in Holland or on the Internet).

Please advise?

thank you.

```
Yes, you'll need a special cable. There are details on building one in the
Quick FAQ, but check the display frequencies on your monitor beforehand.

Cheers for all the help so far :)

It would really be a lot simpler to use the PC for all the 'net access,
etc. but I was hoping to let the ST fetch my mail and post to the
newsgroups while the PC is being used for some other task (like someone
else playing games on it).

Would that be an impossible task?

Hi!
>Just tried http://www.ettnet.se/~dlanor/ and it works fine, what version
>of CAB are you using? He's got frames on his pages.

I can get on fine. I'm using CAB 1.5 (yeah I know its crappy but I'll
get a new version soon). I can load the page with the titles main,
file, sting, etc at the top of the page. I went to the file link and
it came up with some programmes to download but not sting, so then I
went back to try and click on the sting link but it comes up with an
appache errror saying this page does not exist.
I've tried this a couple of times but get the same results. Also
tried using the Newsie web browser.

>ps. sorry for my double posting

Sorry that wasn't the www.ettnet.se/~dlanor/sting page I was talking
about, I was thinking about another one. The www.ettnet.se/~dlanor
page straight away comes up saying this site does not exist. Well
doesn't make much difference to the situation but just telling you
this to avoid confusion.

> Would that be an impossible task?

Not at all, you need to install some NAT-software (like WinGate) on your PC. Then you have to link your ST and PC, and this is where the trouble starts. The obvious thing is to use a simple nullmodem-cable, STiNG will handle this perfectly on the ST but Windows does not support TCP/IP over nullmodem-cables...

It can be solved for sure, but I have given up for now. I'm not really too fond of PCs (I only use mine to run DreamWeaver/Fireworks, and Free Agent now and then) and won't spend much time hacking on mine. I also have a ethernet-card for my TT which I hope to get up and running soon, this will solve my problems.

>- what do you call it? - 'store' of files for public access.

Aha, now I understand you. You went to the RMA homepages right?
You have used http://chapelie.rma.ac.be right?
^^^^
AFAIK there isn't a link from the homepage to the ftp-server.
To go to the ftp-server you must use ftp://chapelie.rma.ac.be/atari/
^^^
One thing. You really must use STing v1.22, Iconnect or MiNT-net in order
to access the server. Lots of people (but not all) using older STing
versions are unable to make a connection.

Some advice for use with Cab:

If you use Cab's own ftp-routines you must use the proxyserver of your ISP
otherwise you probably won't be able to get through.
Instead of using Cab's own ftp-routines you can also use an external
ftp-client, such as aFTP, Gaftp, etc....

Some advice for use with Newsie:
As address you must fill in chapelie.rma.ac.be (without the leading
ftp://)

>the TT.

I use then both now. The sta_vdi.bib is some kind of libary which holds
info about the resolution and so on.
sta_vdi.inf is an info file which holds some addional settings.
You can use sta_vdi.prg without sta_vdi.inf.
I'm glad someone told me about sta_vdi.inf because it has solved a very
annoying thing. See my other postings.

```
; STA_VDI.INF Datei, durch entfernen des ';' wird Funktion aktiv
;
; Schlafecke, Maus in diese Ecke und der Bildschirm wird dunkel
; im Beispiel R=right, B=bottom -> rechts unten
; OFF bedeutet, daï¿½ es keine Schlafecke gibt
SLEEP = OFF
; Wachecke, Maus in diese Ecke und der Bildschirm bleib an

Very important values.
Most VDI's guess a 14" screen.
One of the values, a program can obtain from the VDI, is the actual size of a pixel
in micrometers. The obove SCREEN values make it possible to calculate these
pixel sizes true and exact. The pointsize then can get the official meaning
in the real world of, say, book printers.

I'm moving to Japan, and I'm (sadly) selling nearly everything I own to get there. I've got the following up for auction - click to check it out.

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=neogeoman

Atari ST tech manuals
Atari 8-bit tech manuals
PC Engine CD ROM System, super system card, manuals, etc.
Core Grafx unit - MINT condition, in a box.
NEO GEO FREAK magazines
PC Engine Magazines
PC Engine games
Mint in a box new-style Famicom system
Japanese naked-woman art and photo books (tasteful!)
Japanese playstation magazines
etc, etc etc!!!

Thanks for looking,

Lawrence.

Sent via Deja.com http://www.deja.com/

Source record: 61736

I do not have my complete list yet but my brother has a nice Atari 1040ST System with tons of extra's. I know it includes the 1040ST, Atari Mono Monitor, Atari Color Monitor, Atari SH204 Hard Drive, Monitor Switch Box, and other stuff I do not remember. Before he trashes it all, make offers on what I have mentioned so far and if it makes sense, I will pick all the items up from him and make a more detailed list. Make any reasonable offers and they will be considered.

Thanks

Tom

6241. Wanted: Atari Mega 4 ST Computer! Buy or Trade!

Newsgroup: comp.sys.atari.st
Date: 2000-05-25 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <8gksdcqkd1@user2.teleport.com>

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Adapters exist for both SCSI and IDE, but to the best of my
knowledge you can only use printers on the Atari's printer port.

The 19 pin is indeed for the HD (the computer has one just like
it). I have two of those cables in use, but not the pinouts.

That's curious, there should be a four prong female plug
somewhere to provide 5V and 12V to the drive.

>2. what will I need for software to format it?

For free, AHDI, Atari's drive controller. For fee, HD Driver
has many interesting features (none of which I think you'll need
on a 80Mb drive).

>I do see a bank of pins on the scsi card which don't seem to go

Oooooer! The OUGHT to be a 4-pin connector coming from the PSU supplying
+5v, +12v and 2xGround. Have another good look - hope it wasn't ripped off
by the previous owner. If it was you may have to get inside the PSU to wiree
up a new connector.

> 2. what will I need for software to format it?

Don't format a SCSI, just partition it. Almost anything will do. AHDI (v6, I
think) is widely available.

> I do see a bank of pins on the scsi card which don't seem to go anywhere,

Doubt it very much. More likely to be a connector for an "activity" LED.

with
> my Atari ST 1040?

```
Nope. It's not a driver problem, it's a hardware problem due to
incompatibility with the Atari's Printer port. You can connect a SCSI
version through a SCSI adapter, or buy a parallel port adapter that connects
to the cartrdige port, but is only available in Germany (and is expensive).

This is all detailed in the Quick FAQ.

>from

AFAIR the author had a seperate archive with a sample library. In any case, it's simple enough to set up, start by entering your monitor's low and high scan rates and the clock speed of your SB - 50Mhz IIRC, and activate the external clock.

Adjust the horizontal res slider to whatever you fancy, click on the 4:3 button to keep the right screen proportions. Press the Shift key for the test screen, use the Arrow keys to centralise the image. The upper/lower/left/right blanking sliders can be used to stretch the image out as far as possible whilst keeping the test circle circular.

I've gone into a fair amount of detail because I had a great deal of trouble getting it to work at all, until someone demonstrated it to me! :-)

You're probably much better off selling your system on eBay than
on Usenet. You'd be much more likely to get what it's actually
worth (and perhaps a little more.)

Just a suggestion...

Sounds more like a threat than a warning. I can just see Bill
"The Weasel" Gates standing in front of the hearing committee in
his Armani suit, slicked back hair, and heavy garlic smell
saying, "Y'know, it would greatly behoove you gentlemen to see to
it dat Microsoft doesn't break up. Might cause some 'unfortunate
accidents' to your computers. Maybe der's a virus. Maybe it
totally wipes out you's guys's hard drives. But dat's not gonna
happen, am I right?"

Maybe Joe Pesci could play Bill in the made-for-TV movie.

HIHO.
Does anyone use this software Wensuite3, if so have they come
across this problem. Recently I decided to return to this WenSuite
software after falling asleep with Draconis terrific speed. At the start
everything worked fine with version 3 no problem with the speed at all.
Now for some unknown reason does not recognise my dial script. It
contacts my Demon internet okay but when it comes to my login and
password it stops dead. I have tried every setting available from pap,
manual and auto. I think I have narrowed it down to the sending of the
dial script. As I mentioned before it worked before.
I have tried contacting OXO themselves but no responce.
The funny thing is the same script information works fine with other
software so I am at a loss.

You simply set SCREEN-X to the width of your monitor in mm, and SCREEN-Y
to the height. That's it.

Wrong... SP4 is currently water-tight. This is actually the new
sinclap plug-in for Pierre Tonthat's Atari port of the
Shakespearean Insult Generator program.

And while we're on the subject, how about toner for a SLM-604? :)

I miss the SLM804 I used to use when I was AUNT's newsletter editor. Oh
well, get my other printer going.. someday...

Derryck you're a genious. Yeh, asking for a TEC LB 1301 cartridge might
go over better than asking for a SLM 804 cart. I tried, which was interesting.
(grin)

Alright, how about for Atari's other laser printer.. the SLM-605 I believe
it was?

PS: Dan, congrats on getting Atari mentioned in Mac Gorilla. I always think
it's cool when Atari gets mentioned in other places besides expected
Atari media. So are they looking for articles on Atari news in the
states? Does it have to be current, or deal with nostalgia as well?

what I'm after is all sorts of stuff current from the Atari world,
whether it be new hardware, software, events, announcements, web pages,
etc. I'm also trying to feature as many web sites of interest to Mac
Gorilla readers on what Ataris can and still do.

This actually came as a double challenge - when I discovered Mac
Gorilla (as a link from another excellent web site, As The Apple Turns),
I was impressed that their aim was covering and supporting Mac, Amiga
and Linux news, in fact anything except for Micro$oft. When I challenged
them on why they didn't have Atari stuff, they challenged me to come up
with news to post. Needless to say, I took them up on that, and the rest
took off from there. Their head webmaster has told me that they've
received quite a positive reaction from their readership on the Atari
content. Believe me, I was surprised when they actually named me editor
of the Atari page, and I'm certainly glad to pursue another aspect of my
writing interests in a unique and positive way.

Indeed, the fact that Sinclap is disparaging me and the website only
fuels me to go ahead with the project. The very idea that I'm actually
pissing off that little loser - whose entire vendetta against me and
other Atari users has now gone as far as attacking pro-Mac websites and
publications like MacAddict (probably because said websites and
publications publish the truth and aren't affected by the Steve Jobs
Reality-Distortion Field(tm)) - has me convinced I'm on the right
track. Perhaps the "Clap is jealous because I've now got a forum where
people listen to what I present, compared to the fact that he's been
screaming like a spoiled three year old who no one will listen to thanks
to his odious and noxious personality. It makes me laugh to see Sinclap
shoot himself in the foot over and over again......

BTW, I'm looking forward to that next installment of what happened
when you took your Atari to work after the I LOVE YOU virus knocked out
your computers at work.....

Hello all,

Rob Mahlert of Atari-Users Net asked me to post the following:

From: Rob@atari-users.net (RMAHLERT)
1:59
am

To: ALL
(1
of 1)

9712.1

Hello,

Unexpectedly.. the hosting service shut down the Atari-Users.Net
(AUN) website. The new hosting
service is already setup, but it will take a day or two for the DNS
records to be updated on the web and a
few days more for me to update all the services. (Bad time to
happen.. I'm moving this weekend!)

If you have an e-mail account on AUN, everything SHOULD be fine, the
new host is already setup for the
e-mail. A few e-mails might get bounced while the DNS records are
being updated. If you need to access
the e-mail system, use this url: http://atari.services.everyone.net
(soon to be http://mail.atari-users.net)

With the move... comes new services at AUN, we will now have a public
ftp site.

AUN's ftp server: ftp://208.56.156.115
AUN's new IP address: http://208.56.156.115
(www.atari-users.net should be working within the next 2 days)

An Epson Action printer, as I recall.

> Newsie and CAB or is it just an anachronism?!

I used to use Oasis. Oasis 1 was *in its time* wonderful, mainly because of no real competition. However, it was still defective in several ways (notably broken/non-existant references lines) and had a weird interface (horizontal scroll bars for vertical scrolling) when the authors ditched NOS and did Oasis 2, which was frankly a disaster. The NOS replacement was hopeless and the Oasis bit was iffy. Plus expensive shareware. Then the authors just dropped the whole thing.

NOS, on the other hand, is pretty amazing, and someone was maintaining/developing it up till recently (I believe he'd also GEMmed it). BUT, you can't use it with STinG or STiK as it is its own stack. Most people using Oasis 1 switched to NEWSwatch and POPwatch for news and mail respectively: these download in NOS or Oasis2 format using STiK/STinG for the connection.

However, if you are downloading in NOS format, you should really look at Okami, which works very nicely in conjunction with POPwatch/NEWSwatch/STinG. It's still being developed and is by far the most capable mail/news program on the Atari platform (complies with most standards, does MIME, UUE, proper news and mail threading, integrates with PGP etc).

I also have an 804 which I'm now using after many years of it being in a box. Old rusty synapses in my biological ram suddenly started working. Try http://www.ribbontoner.com/ for American Ribbon in Florida. It used to be Florida, anyway, and they spoke Atari! I was surprised, and the toner boxes even had the Atari listed. I still have mine.

You do need javascript to view the order pages, so just in case, I've copied some info that follows, the formatting will be all messed up here, tho':

Laser TEC

6291. Re: Mach64 video card

Newsgroup: comp.sys.atari.st
Date: 2000-05-27 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <LdRX4.4014$4X5.8978@newsfeed.slurp.net>
Source record: 61597

Well I went to the website that was posted where everyone was saying
that the hard drive would be accessed because of the animated gifs.
Well it happened to me also. I just hit the STOP button in Cab and it
that solved that. Funny how I never noticed it. My disk drive was also
being accessed which is strange. But the website was not slow as some
people have said. Still, the hard drive access does not happen on every
website which is a mystery. I am wondering if it is the Mach 64 or
something with Cab.

6292. Crazy Dots Card working...

Newsgroup: comp.sys.atari.st
Date: 2000-05-27 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <NdRX4.4015$4X5.8978@newsfeed.slurp.net>
Source record: 61598

Well I finally got that Crazy Dots card in my friends TT working.
Thanks to everyone who helped. It was the original drivers that was the
problem. Someone sent me his setup with an older version of NVDI 3 that
did the trick. My friend is going to buy NVDI 5 which may work alittle
better. I tried to make some new video modes as I have done with my
Mach 64 card, but that did not work. So I looked into the library file
that came with the card and found a INF file that worked fine. Of
course I could only get 256 colors, but in all the resolutions. I
assume that the card is version 1. It would be nice to get the 32k
video mode, but I will settle for 256 colors.

No, the problem is that you need to trash all of v1.15 (except for your
Default.CFG and Dial.SCR files), then install v1.20.

Only then can you put in the Kernal, Serial, TCP, and UDP files to upgrade
to v1.22.

Get the archive for v1.20 and the new stuff for v1.22 from my website,
http://www.users.zetnet.co.uk/jfhaslam/atari.htm and follow the Downloads
link.

Cheers!

6297. Mega STe conflict internal and external harddisk

Newsgroup: comp.sys.atari.st
Date: 2000-05-27 00:00:00 UTC
From: "W. Buising" <wbuising@grip.nl>
Message-ID: <8goscuncb1@news1.xs4all.nl>
Source record: 61603

I just purchased an megafile 30 external harddisk. It works fine with my 1040 STf, but I also want to connect it to my MEGA STe, to make a backup of the internal harddisk.

When I connect it to the ACSI port, switch it on and then switch on the MEGA STe both the internal and the external harddisk freeze. I can only boot from the floppy and there is no other device found. When I disconnect the internal harddisk the external one works fine, it seems that the 2 interfeare with eachother.

Is there anything like a SCSI ID ore something like that, so that I can make the internal HD and the external one work at the same time, or is there some other trick to this?

Please help.

Willem Buising

6298. WARP 9 ---NVDI : Worth it?

Newsgroup: comp.sys.atari.st

Source record: 61604

I own a 1040STf with 4 MB Ram. I use Notator/Creator sequencer. I was wondering if anyone out there uses WARP 9 or NVDI 4, which I believe are similar products to speed up graphics on the software you are using.

Anyone know where to get the items and have any recommendations on which is best for my system, please respond. Maybe someone has one to sell?

help much appreciated--- Larry

Yes, this seems like a likely explanation. The HD in the Mega is almost certainly set to ID 0. You need to change the SCSI ID of the other drive. If you are lucky there may be an external switch. Otherwise you will have to dig deep enough to see the back of the drive. Ususally, near to the 50-way input port, there is a group of 3 pairs of jumper pins. Just set the middle pair and the HD will respond as ID 2.

Roger

P.S. Of course, it might be more complicated than this :-))

>http://www.users.zetnet.co.uk/jfhaslam/atari.htm and follow the Downloads
>link.

I did that and just kept my account information. It booted up fine
saying v1.20. I went into the Sting accessory and it said the dialer
version is 1.16 and sting was 1.20. Aren't they supposed to be the
same version?
So I went to load newsie but it keeps on frezzing up, not just on
newsie on every program I load.
Surely I need dialer version 1.20 don't I, which it states in the help
files.

Me too have used Oasis for quite some time and despite the many
shortcomings I did love it. For its time NOS was a very powerfull prg.
NOS allowed you to do several tasks at once even without a multitasking
system. Whilst for instance you were downloading some stuff from a
ftp-server you could download your mails and News messages.
IIRC one could send/retrieve mails/Usenet messages, ftp and telnet all with
the same program.
The weakest point of the whole concept was however the GEM part, Oasis.
The latest version, 1.35 was still far from bugfree but as said earlier
despite that I did love it. I even prefered Oasis above Newsie.
It just with the coming of Okami that I ditched Oasis.
Like you says Oasis 2.x was a disaster. The NOS replacement, ICE was just
one piece of sh*t. The Gem part was however useable but far from bugfree.
>
>NOS, on the other hand, is pretty amazing, and someone was
>maintaining/developing it up till recently (I believe he'd also GEMmed
>it).

The latest version of NOS can be found on the Belgian ftp-server. I never
tried it but I believe that with this version one can use Cab too.

ftp://chapelie.rma.ac.be/atari/internet/nos/

internet/nos:
-rw-rw-r-- 1 ftp 195191 Sep 3 1999 nos050.lzh
-rw-rw-r-- 1 ftp 194476 Sep 3 1999 nos05030.lzh

>However, if you are downloading in NOS format, you should really look at
>Okami, which works very nicely in conjunction with
>POPwatch/NEWSwatch/STinG. It's still being developed and is by far the
>most capable mail/news program on the Atari platform (complies with most
>standards, does MIME, UUE, proper news and mail threading, integrates
>with PGP etc).

Okami works indeed very nicely with Popwatch/Newswatch/STing. This trio
can also be used with MiNT-net/gluestik. AFAIK, STing and Okami are still
under developement (Okami is right now under heavy development) but I
don't believe that Popwatch and Newswatch are still supported.

And indeed it's by far the most capable mail/news program on the Atari
platform. It's maybe a little bit hard to set up the whole thing but it's
surely worth the pain.
Okami works with (almost) every OS that's available on our platform.
TOS: No problem
MiNT: No problem
MagiC: AFAIK no problems too
Geneva: I believe that Okami 2.x doesn't work with Geneva.

Ofcourse to get the most out of it, it's better you use a modern
multitasking system like for instance the outstanding MiNT/N_AES

I'm glad you have it too. I was already thinking is was going mad of
so.:-))
Do you mean the homepage of Marc-Anton Kehr? His site has been reworked.
Most of the heavy animated buttoms are gone. Believe me with these buttoms
it was almost impossible to scroll down the page.

Go once to:

http://user.online.be/~ols04484/aq-kortrijk/index.htm.
That page holds an animated welcome picture.
To see another example follows the 'artikel' link and then one of 5 links
(zoetwatervissen, etc.) All 5 pages holds animated waterbubbles.

Both the welcome and bubbles gif does make my HD spin.
There exist an utility that monitors the access of the HD, I believe it's
called Fritz.

ftp://chapelie.rma.ac.be/atari/multitasking/MagiC/fritz523.lzh
According to Fritz it's partition C that is accessed.

AFAIK it's the fault of the sta_vdi. I also found that when I don't use
NVDI 5.03 as fonthandler my HD doesn't spin.

Martin - went to the page you mentioned and had no problem with my TT and Mach64 card. Animations run fine with no use of my hard drive. Using MagiC6/NVDI 5.03 and Nova driver 2.66.

I have used WARP9 on a mega ste with 4mb and Cubase 2.01 and must say that on this machine there is no substantial better performance. Of course the mega ste is a 16Mhz machine so perhaps on the st there is a difference. As far as I know there is no need to purchase WARP9.

if you're using Notator, then I'd definitely recommend getting NVDI.
I had Warp 9 and I had nothing but trouble getting it to tape sync via
MIDI. When I switched to NVDI, the problem disappeared!

6310. ? 'bout SyJet 1.5

Newsgroup: comp.sys.atari.st
Date: 2000-05-27 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <39306fd0$0$81162@news.execpc.com>
Source record: 61616

Hi All,

I was able to find a SyJet 1.5 External SCSI hard drive to
replace my ailing SyQuest 200MB which will not format.
(I don't have software, manual, or PC to mess around with it.
I bought it at a rummage sale at work - and it worked fine on
Atari for years.)

The SyJet is already formatted to PC.
1.) Is it possible for me to partition, or will I have to reformat
entire drive with HDX or HDriver?

2.) Can HDX (v5.03c) format a drive of this size?
I think I would prefer to use my standard AHDI 6.05c.
Mostly because of cost.

Thanks for your comments and suggestions.

ken

>orders to make it feasible. I suppose an ad will come up here soon.
Don't hold your breath...
It's not the first time Mr. Czuba takes us for a ride... about a year
ago he drove all the TT users nearly crazy announcing a Centek card for
that machine, all that was needed were 30 orders to make it feasible
(where have I heard that before).
Well instead of 30 there must have at least been 200, people reading the
French, German and English newsgroups could hardly wait to pay for it.
Ever since.... nope :-(

Cheers from Belgium
Dennis

Hi galen,

>>>Is Magic Milan available?
>>Yes, in German.
>Hmm, that's a bummer...hopefully an English .RSC will become
>available.
MagiC doesn't have a RSC, one has to patch the code and since this is a
commercial program, spreading such a patch on the net is illegal since
it would contain the serial number.

However, once you got an English desktop running, you'll hardly notice
that MagiC itself is in German, once in a while an occasional error box
might pop up, but if you can live with that....
MagiC Milan that is installed on the MilanII will be in English, if it's
bought from an English & American distributor that is.

Cheers from Belgium

The SCSI ID setting will be on the drive mechanism itself, the internal drive should have the lowest ID of 0.0.
If your using the Atari HD interface you may be out of luck, i never could get any extra drives recognised with my Atari HD-i, i eventualy bought a link96 internal for my MegaSTE and can now have 8 daisy chained devices on the SCSI bus.

There is a good CP/M emulator for the ST. I used it frequently in 1986
when I transferred my business files from a Heath H-89 to an ST.
Mostly moving Dbase II command and data files over to dBMAN on the ST.

The CP/M emulator is probably still on some of the university FTP
sites. I have it on floppies if you can't find it elsewhere.

:>
:>Nokia make SVGA monitors with TV capabilities, wouldn't these
: work fine?
: Probably. You might have to play with connectors, though.
: Where on Nokia's site did you find them?

Some models were reviewed in Swedish mag Amigaï¿½Info some years ago,
haven't looked at them closer.
Further on the topic of multisync monitors, I found a cheap NEC Multisync
3D some weeks ago, quite a splendid monitor, albeit the digital controls
feel somewhat limited. You might want to add some resistors into the
connector cable to make the image darker, though. I then went on to find a
NEC Multisync 2A, but its 15 KHz results are far from satisfactory,
transposing one half of the image on top of the other. Is this no real 15
KHz multisync, perchance?

6322. STinG 1v22 problems

Newsgroup: comp.sys.atari.st
Date: 2000-05-27 00:00:00 UTC
From: bindon@madasafish.com
Message-ID: <sivfvogo5pj91@corp.supernews.com>
Source record: 61692

Hi

I recently had problems accessing some sites with my old version of sting so I decided to upgrade to 1.22. Couldn't find it but Martin Byttebier (thanks martin) helped me out and sent me Kernal 1.22 (1.05) Serial 1.20, TCP 1.33 and UDP 1.45.

I replaced the old ones on my boot drive with these. When I booted up all things went well reporting on boot up STinG version 1.22 (1.05), loading the new Serial, TCP and UDP stx files and my old Resolve stx file from the old Sting setup.

I then went to the Sting ACC (I'm not mutitasking yet) but it said Dialer Version 1.15 and Sting Version 1.22, is this correct?

I then went to dial up and connect. It dialed up fine and said the connection speed alright but then crashed with 3 bombs jest before the bit where it gets the IP number.

I've tried this a few times now with a minimal sysatem i.e. HSModem, Sting and HDDriver.

Any help will me much appreciated.

Not true, TCP/IP can work over direct cable connection, however you will have the problem of trying to get the ST to log onto windows. You will need a proxy server to IP alias your network on the windows computer. I have never tried this with an ST but I was able to share an internet connection both sucessfully over a parallel cable and a null modem cable between windows computers

Check out this site as it may help.

>with Nova-VDI 2.67.

I realyh wished I knew what happens. All that spinning is surely not very
healthy for the HD. I suppose you use NVDI too. I've found that without
NVDI the HD isn't spinning.

>
>> AFAIK this only happens with CAB, programs that can display animated GIF's
>> like PixArt, Wensuite, Draconis etc.. don't have this problem.
>
>How large is your image-cache in CAB? Animated GIFs takes a lot of space
>when they're unpacked and transformed, especially on
>truecolour-displays. I have a 4Mb cache, but if I used 16-bit colours I
>think I'd double that.

The image-cache is set to 12.288 Kb which should be sufficient I guess.

BTW: I do have another program that makes my HD spinning. PlaymyCD. If
PlaymyCD is running it's not very pleasant to type a text in for instance
Everest. Typing/erasing text and so doesn't happen smootly. Sometimes
there is a small delay between the keytouch and the actualy action.
Luckely I'm a two-finger typer:-))

Tried that as well.
Tried using sting version 1.20 and 1.22 with dialer 1.16. Same
result, looks up on running any program. The only thing it could be
is HDDriver v7.8 something. I might try an older version then.
Might try booting off floppy as well.

Thanks for all the help guys!

>you take a good look at your setup.... something isn't right, for sure.

Nor here, i only get crashes when i use crap/ancient software and then the system recovers and i carry on working. In general i find my MAGIX OS configuration almost bullet proof.

Maybe its the way peop's have their system setup. Its rare to see a system with all the latest add on's, upgrades, drivers etc, so that maybe a factor.

But i must add, in a reasonable world, how do you expect a piece of software to react if some plank goes and delets the files it using, under normal circumstances these files wouldnt dissappear on their own accord, so i think this example is irrelevant!!.

If it formatted for a PC, then you should be able to partition it with
no problem. I did the same with my Jaz carts. They were formatted for a
PC and I just used HDDriver to partition it.

>2.) Can HDX (v5.03c) format a drive of this size?

I'm using NVDI 5.03. Btw. don't worry about wearing out your HD, they work
a *lot* harder on systems with virtual memory (which includes just about
all operating systems known to man except ours...).

"Assumption is the mother of all f**kups" :-) First of all, open files
shouldn't be possible to erase in the first place. And more important,
the OS shouldn't crash on something as trivial as invalid
file-descriptors.

> John
Stange this I have used with no probs oasis 2 all the time I used th Tari

for net stuff it works fine and only okami comes near it. yes it was
expensive shareware for it's time but used with popwatch & newswatch was
without dought the best news/mail reader there was for the Tari. I was the
last registered user at no 49 (not a lot of money for the work that must
have gone into it)
If you have the share ware version it has the best set of instructions ever
for a shareware prog & well worth having a go at. if you have v 2.05 this
was the most trustworthy but v 2.10 is ok as long as you do'nt use ICE (the
stack) use sting/stick to connect popwatch/newswatch to download & oasis as
the reader

Lots of fun for all the family :)))
Pete

Don't hold your breath chaps! I challenged the guy in this group some time ago to come out with a definite plan and some dates - big zilch in response from him.

His on/off approach has killed one definite plan to bring out a new printed magazine (the guy's doing other things now and doesn't have the time).

I'm almost tempted myself to do something, but.....

;-)

Best wishes
Mike Kerslake

What systems are people using Magic on? I've heard that on ST's,
Magic is quite stable, but on Falcon's, it's not nearly as stable. I
know that through my experimentation on my Falcon with Magic 6.01, I
have yet to get a really solid Magic setup. I've tried everything
that people have suggested. There are many times when Magic won't
even make it through the boot-up process. In fact, often it gets
through the initial loading of the Hard Disk driver, runs the
Magxboot.prg (I've tried every combination of Magxboot, Magxbo32.prg,
and Magtorom.prg with the same effect), gives me an ST-High blank
screen and freezes up completely. Other times, I get unexpected and
unexplainable crashes. I've tried everything I can think of,
including running just a bare, clean Magic setup, with nothing else
in the AUTO folder or accesories. It simply doesn't work well on my
Falcon. I have a feeling that these instabilities with certain
systems are why some people have problems with it and others don't.

Maybe your Falcon needs a clockpatch. MagiC runs fine here since I did
that. Ofcourse, a standard Falcon has speed and screen rez limitations.
In general: 640*480*16 is OK.

Lyndon,
Maybe this Sting DEFAULT.CFG file will help!
Note that it works well on my stock Falcon030/NVDI (No Magic, Mint, etc.):
John G.
# The following Sting default.cfg file is suggested by Ronald Andersson
# Keep (#) before lines
# Use with the latest Sting files (as of 11/29/99)
# Dialer Ver. 1.16 (MTU=1500).
# CPX Panel: No Sting Port or Protocol. Only Internal's CPX used
# with 'Active' box X'ed and Delay set for 20.
# On my 14meg Falcon 030 (MKI), MUST use HSMODEM7 (Driven/SCC/SETTER.TTP).
# Connection did'nt complete with SETTER.PRG (HSMODEM6).
# Auto folder order: Last three programs-- Driven, SCC, STING
# ALLOCMEM might be lower
# Fill in missing info with your particulars
#
# This is the STinG relevant stuff.
```

```
#
ALLOCMEM = 300000
#
THREADING = 20
FRAG_TTL = 60
#
ICMP_GMT = -60
ICMP_AD = 10
ICMP_FLAG = 0
#
TCP_PORT = 1024
MSS = 1460
RCV_WND = 32000

He would be better off making the ID 1, which will be one of the end-pin
pairs, as there are some hard disk drivers (such as AHDI - at least
early versions) that will not allow a gap in the number sequence - it
has to be 0, 1,....

Thomas J. Andrews writes about HP DJ500 ink carts and refills:

I've been refilling my HP DJ carts for several years. The hardest thing is to make sure the circular area on the bottom is clear. But it works great.

I have also used Blue ink in one emptied cart to do special printing. It too worked fine. I don't do that now as I have a Canon BJ color printer(I refill its carts as needed). But a color ink kit for any HP DJ5XX series that does color should work fine.

I am still looking for white ink to use on dark papers.

<<<snip>>>>>>
Hi
Thanks john but still nothing. I can't see why it locks up when
loading a programme. So I tried running off floppy, still the same.
I removed everything except STING.ACC DIALER.ACC even removing
HSModem. I then removed a modem port accelerater so it went at original
19.2k speed but no luck. Tried TOS 1.62 and 2.06.
I then got the archive from James Haslams site which comes with dialer
version 1.16 and sting v1.20. I installed in on a floppy keeping the
script and cfg files from it.

<<AUTO>>
Sting Kernal 1.20
<<ACCs>>
Dialer 1.16
Xcontrol
<<CPXs>>
Sting internals (set active)

This is starting to get a tad bit boring and I think the others are as
well. I'll dig an old stfm out the loft and try it on that.

>
>It would come soon.
>Anyone ever heard anything?

Last was that it was to be released at the AMS in Stafford a few months back,
but that the publisher had to withdraw for whatever reason.

There's no particular need to start another magazine because the FaST Club
have relaunched STApplications (as Atari Applications), and I'm sure that
this will build up nicely given more publicity.

6349. Atari Portfolio solitaire game for download

Newsgroup: comp.sys.atari.st
Date: 2000-05-28 00:00:00 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <393065ec4ac2281@tripnet.se>
Source record: 61622
Cross-posted to: comp.sys.atari.st,comp.sys.handhelds

I have put a solitaire game written in PL1 for download on my homepage.
The program file (SOL) uses 4825 bytes. You will need PL1.COM (12673
bytes) to run the program. PL1.COM is included in the package.

This program is mainly intended for the Atari Portfolio with its
limited memory and screen size but will run on any PC in DOS mode or in
a DOS window under Windows. It behaves almost identical to the SOL.EXE
that comes with Microsoft Windows.

For 1985 machines (only the 520ST was available at that point in time),
that is true.

From the start of 1986, with the release of the 1040ST, TOS 1.0 moved
into ROM.

(I haven't seen or used a 1.0 machine in nearly 10 years, but from
memory, the UK 1.0 ROM had a date of 20-November-1985, whilst the
disc-based version was sometime in May 1985 and had a file size of
206-odd thousand bytes)

I bought a 520ST with TOS 1.0 in ROM in May 1986.
It must have been one of the first batch of ST's. with TOS in ROM.
It did not have an FM port for connection to a TV.
The TOS was dated November 1985

>When a file is opened and not closed, you delete this file, it's the
>crash !
Not so if you use symbolic links, point the file for example to drive U,
nothing will crash... you just get an error 33 (file not found).
If you don't like to use symbolic links, then use Kobold to delete files,
and make sure that *CHKOFLS* is activated in the Start folder.

>All versions of MagiC has this problem. It's not an hardware problem. it's
>a bug. Sorry.
I can't reproduce the bug... at least not with MagiC 5.20, 6.0, 6.01 and
6.10. Considering that some more people here can't reproduce it, I suggest
you take a good look at your setup.... something isn't right, for sure.

Cheers from la Belgique
Dennis

Same thing happening here, but saying that the driver is no good because of
this is stretching it a bit far....
AFAIK this only happens with CAB, programs that can display animated GIF's
like PixArt, Wensuite, Draconis etc.. don't have this problem.

>I know I can patch that driver but then the animated gifs looks rather
>awfull. I don't know if that problem also occurs with MagiC but it surely

Hi Daniel,

>Besides there is a Papyrus home version promised with the Milan package,
>so I think that they will be supporting us in the future.
Milan has decided to bundle Tempus Word Pro 4.0 instead of Papyrus home, a
very wise decision... Tempus is the only wordprocessor on our platform
which may carry the "Pro" extension, without having to blush. There's
absolutely nothing "Pro" about Paypyrus at all.
BTW: does ROM mentions what "supporting" means to them? if it's releasing
an English update once every four years....

Cheers from Belgium
Dennis

Lyndon,
Latest Dialer should be 1.16
If your not useing HSMODEM7, try that! Some have had success with
HSMODEM6 but I had to use 7 on my stock Falcon030. I also use only one
CPX, Sting Internals (activated).

6360. Magic 6 and Fat32

Newsgroup: comp.sys.atari.st
Date: 2000-05-28 00:00:00 UTC
From: leaver@netinfo.com.au
Message-ID: <yT3Y4.791$ZD6.510279@news0.optus.net.au>
Source record: 61633

In recent postings Uwe Seimet has referred to Fat32 as if it exists for Magic. Bengy Collins' Magic page lists Fat32 as a feature of Magic. Yet the English manual, while explaining VFAT, makes no mention of Fat32.

What's the story? Is there some extension that I need if I want to use Fat32, and, if so, where can it be obtained?

6361. New Additions to Tims Atari Midi World

Newsgroup: comp.sys.atari.st
Date: 2000-05-28 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8gqnlr$c8o$1@nnrp1.deja.com>
Source record: 61634

Hello All

I am pleased to announce new additions to my site:

1.The Ludwig Algorithmic composer (Hybrid Arts)Download is now
available. Just made Freeware!

2. A 030 compatable version of TUNESMITH provided by Donald Skaggs (one
of our new members on Atari-Midi) This means you can run Tunesmith on a
TT030 and Falcon! Tunesmith page updated with more material.

3.DxHeaven caged artist editor. Two versions. One is MPE compatable
while the other is an earlier version.Take your pick!Just what the
title says for DX programming!

4.D110 editor, caged Artist series. Works for D10,D20 and Mt-32

5.Tronds TOS version Fix for MidiDraw:update on the MidiDraw page.
If you had problems with midiDraw working on your STe, there is now a
solution.

Now I have to work on Copyist. Cris Sion just gave me permission to
release it as freeware, but still have to create the page.

I would like to invite any of you to the Atari-Midi mailing list. Dr T
even joined us.See sig.

Have Fun!

Tim

>
> David K.

Hi David

I am just starting to use it and I am very impressed by it. The best scoring program for Atari I have seen. Works well on my TT030 on TT-HI (1280x960 res!)Wish I can find the original company/programmers so I can get it released as freeware. Would probably make a good topic for Atari-Midi (the mailing list..see sig)I still have to work more with it however. I like the fact it works with Gdos and speedogos so you can use scalable fonts.

Tim

It really should work with Cab 2.80. As said in previous postings I MUST
use a proxy-server to access the ftp-server. There are really not many
ftp-server I can visite without proxy-server. For the most I do need the
proxy-server.
If you ISP offers a proxy-server please tried it out

In the meam while I did some tests.

1) Without proxy

URL: ftp://chapelie.rma.ac.be/ ---> homepage of the RMA
URL: ftp://chapelie.rma.ac.be/atari/ ---> Error, page not found

2) With proxy

URL: ftp://chapelie.rma.ac.be/ ----> ftp-server
URL: ftp:chapelie.rma.ac.be/atari/ ---> ftp-server

HTH,
Martin

I don't know why it happens with you guys, it sure doesn't here. I have a
Falcon with Afterburner, 64Mb fastRAM/4Mb ST-RAM and a 1Mb Nova Mach64
with Nova-VDI 2.67.

Btw. perhaps it happens here too, only that it reads from the
disk-cache...

> AFAIK this only happens with CAB, programs that can display animated GIF's
> like PixArt, Wensuite, Draconis etc.. don't have this problem.

How large is your image-cache in CAB? Animated GIFs takes a lot of space
when they're unpacked and transformed, especially on
truecolour-displays. I have a 4Mb cache, but if I used 16-bit colours I
think I'd double that.

Actually, I believe the ALT-click method is documented. However, I
wouldn't blame MagiC in this case but rather Harlekin. Harlekin is one
huge POS which should never ever be used on anything but plain TOS
(<2.06).

The manuals have not been updated for a few years.

> Fat32, and, if so, where can it be obtained?

You need HD-Driver 7.80 or newer, and some way to initialize a FAT32
filesystem. For MiNT there is a tool called makefatfs.ttp, there is
probably something similar for MagiC. If not, you can use makefatfs.

I have stated this several times before:
All you need to make it work is a "faked" modem driver on the Windows
side. I have used a nullmodem ppp link between my pc and TT for a
couple of years now with STinG doing the ip-masquerades. Works perfect
as long as you first "dial" from the pc side and then activate the port
in the STinG cpx. My pc is hardly ever directly connected to the modem.

I've just blown most of today doing that, it took me ages to get my
old copy of V1.5 working again. If I try again I'll put the installation on
a floppy first then boot from it. The odd thing was that the Sting Protocols
CPX kept killing Xcontrol ! (Actually it killed Zcontrol too.) I managed to
get a connection with all the PPP hand-shaking, but nothing would resolve.
(POPWatch, Cab, GapFTP....) All this is under Magic, BTW.

Portfolio data exchange between Mac using MagiC Mac ....

I know this is possible but don't know how to do ....
I want to transfer data from/to my Portfolio to/from my serial Macintosh.
Until now I have not been able to achieve that.
I'm using the same programs I used when I was on the TT030: one program
is STTRANS on the Mac (before on the TT030) and PFTRANS on the Portfolio.
Normally in MagiC Mac we can define and redirect the Mac outputs we want
to use and this works very well with printers (I'm using Stylus 500 and
Apple laser writer 4/600 PS ... without any remarkable problem excepting
Calamus which needs at least SL99 with an optional :(module MACPRINT to
achieve printings ....

If anyone here is using Portfolio transfers with his Mac and MagiC Mac I
will be happy to receive any hints to achieve this on my computer.
Thank you in advance !

I see everyone is guessing! It was the Epson EPL 6000 to be exact. Parts and consumables are still available on the Espon web site, but aftermarket suppliers are cheaper. For example, drum kit from Espon is $129, third party suppliers usually give it for about $99.

He has occaissionally popped up here and on Atari Central to leave a
stealth message. He disappears as quickly as he appears, and does not
respond to email. At one time I had the URL to his web site, which
primarily featured family news, but I deleted it since he does not care
to acknowledge us.

6378. Crazy Dots (oh no not again....)

Newsgroup: comp.sys.atari.st
Date: 2000-05-29 00:00:00 UTC
From: Freek Munniksma <fmunniksma@wanadoo.nl>
Message-ID: <3932ae85$0$14429@reader3>
Source record: 61501

Hello everyone,

with help of the previous posts in this NG about the Crazy Dots i got this VME videocard working in my old Mega STe. (Still looking for a TT in Holland!) Edward S. Baiz mentioned in his last post that he couldn't get further than 256 colours. I have the Crazy Dots 1 with the 32K extension. With the original drivers and the old AMC GDOS supplied in the original package i could get 32K colours,but alas almost none of my software worked. Finally i got it working using only NVDI5 with the ET4000 option. Most of my software works, but NVDI doesn't seem to support the 32k option. When i try to display pictures in 32K they come out green! 256 colours work fine though. I got the VME4000 program from Jo Vandeweghe's site (http://www.ping.be/~pin10575/CRAZYD-E.HTM)and found out it has only the options for Crazy Dots 1(up to 256 colours) and 2(32K). Video modes made with the "2" option don't seem to work, while the modes made with the "1" option don't use 32K.
If anyone has found out a solution to this "luxury problem" please let me know!

Greetings, Freek.

Hmmm...runs fine on my Falcon. Only problem is that since the CT2
upgrade, it freezes on the blank screen, and you have to do a warm reset
to get it to boot. I believe Rodolphe has contacted ASH about this bug.

Years ago I recieved ST Applications.
But it watered down and seemed to have been blown away in the winds
of time.

But a short while ago I heard they are re-gearing and re-vamping the
magazine.
But its seems they go so quited about it without any fireworks.
Praise yourselves a lot more here so we know what beautifull things
there are to read....

FaST Club YES!
Are they on the net? WWW-page?
And let them tell us more; so many Britishers are without magazine
and waiting for something to start up.
And something seems to have been started up. To what state now?

Yes more publicity.
What is the latest issue and what is there in it to read (kind of
articles)?

No using Newsie 0.94. It locks up on other programs. It loads then
before I get to see the File etc menus, it locks with the busy bee.

The only thing it could be is using the dialer as an accessory or
using Xcontrol not Cops, Zcontrol.

Jo,

Thanks.

I have found makefatfs. I already owned HD Driver 7.80.

I have experimented with a Sysquest cartridge, to avoid making a mess of anything else. I set the one partition to F32 using HDDRUTIL. Makefatfs would not work on it until I had done that, but when I had done it appeared to work properly.

However Magic then says that the drive is invalid, even after a cold boot with the F32 cartridge in the drive. I suspect that something has to be switched on in Magic, in the same way that VFAT partitions have to be turned on.

> err 2000, and we have something called search engines. Or we could look at
> Mr. Bales's .sig.

Here in the United States, we've just had a long weekend honoring those who fought and died in the two world wars. And over the weekend, I happened to think about this discussion of FAQ's again.

When someone asks a question in this newsgroup or any other newsgroup, any person who responds to the question is assuming the role of a teacher. I believe you incur some obligations when you take on that role.

People, or students, ask a question when they do not know the answer. When you were in school, how would you have felt if you asked your teacher "How do I add 12 plus 13?", and the answer you received from the teacher was "I told John and Alice how to do that yesterday. Go read the answers in the book."? And no one has bothered to tell you where to find the book.

A _good_ teacher never assumes his or her student is in possession of all the information needed for the student to successfully find the answer for which the student is searching. Think back to when you first bought your ST and had a questions. What would you have said to your dealer if he had said "I told the guys who bought a computer last week how to do that. Go ask them."? May I assume you would not have been very impressed with this dealer?

If this were 1994, and you had told me to go do an archie search, your reply to me would have meant nothing, for in 1994, I could do email, but I had no idea what an archie search was. Even if I had known what an archie search was, I had no way of performing it. (FWIW, I still don't

understand exactly what an archie search is even today, and therefore could not do one.) Today, using search engines can provide results from useful to useless, all depending on the search engine and the parameters you give them.

I don't wish to start any kind of mean spirited argument. It seems to me we have a number of people who, in their desire to help another Atari user, provide answers that are not understood by the person who asked the question. I am merely saying the help being offered is sometimes not helpful because the person asking the question is still missing necessary knowledge.

In the years past, when we actually had a computer company making hardware, the official online home of Atari was Genie.com. In those days, in the discussion groups, you repeatedly saw the same questions repeated. And they were patiently answered, as we knew these were individuals who were new to Atari computers and needed help. The spirit there was one of always being helpful. No one ever complained about the ignorance of others, answers were always cheerfully given in the hopes of having another happy user of Atari computers. I think it is unfortunate that some who reply to questions here do not seem to have this feeling of patience towards new and/or returning users.

If the remaining Atari users truly wish to see this platform survive, we have to do more than be curt with our replies. If you alienate a new user with your reply, do you think that user will want to keep his Atari computer, or move one to a Mac or Windows machine?

> : I've always believed that no question is stupid when you don't know the
> : answer. And to be made to feel stupid by having a question answered
> : with something useless like "Read the FAQ (but I'm not going to tell you
> : where it is)" is ill mannered and somewhat unfriendly, IMO. Not the
> : reputation Atari users should want to be associated with.
>
> Ill mannered? Bollocks. Asking questions which are answered in he FAQ is
> ill mannered. Directing someone to the FAQ is helpful.

Let me ask a question about the FAQ's. How do you know a question has been answered in the FAQ's if: 1) You don't know the FAQ exists. 2) You don't know how to find them, because you are new and do not know that the authors of the FAQ's have the addresses in their signatures. 3) You don't know how to access them even if you are successful at downloading the file to your computer?

I agree 100% that directing someone to the FAQ is helpful. My position is that the way in which it is done less than friendly and helpful. It can be read as patronizing, and a new user may wonder why he/she even bothered to seek help. I have noticed that Mr. Bales has moved the location of his FAQ to the body of a couple of his replies. This is definitely more helpful, IMO, than just putting a location in his signature file where the questioner may or may not conclude that the answer to the question can be found there.

A truly helpful reply to a new user who obviously needs help (otherwise why would the user be asking the question?) would be something like "You can find your answer in the FAQ located at http://www.******.***/****, and if you need more help, please ask again."

This has been gone over several times when Oasis has came up as a
subject here so I'll keep it short - may be worth checking Deja if you
want the full gore.

Nutshell version is that Oasis 2 worked fine on some machines, but on
others (including mine) couldn't be run for more than a couple of
minutes without crashing. Plus redrawing the screen umpteen times every
time you opened a message etc. Fortunately I never registered 2 (I paid
for Oasis 1), as some people who did never got it stable and were left
high and dry when the authors dumped the program. Which was sad as lots
of people had been very supportive of their efforts from the start, and
the good will was squandered when they stopped answering emails etc. It
was reading reports of that and my own experience with the demo which
made me steer clear of using it - I hung on to Oasis 1 until I
discovered Okami.

- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or shrink-wrapped/sealed titles
for:
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7 and 12 thru 20
- Rarer Star Trek Items by Playmates

I have just set up 2 1.2 gig hdd's on my falcon (ide and SCSI), I also have a 200MB syquest 5 and a quater drive. Hddrive (7.6) can scan the device but refuses to do any thing with it. AHDI work's fine as does ICD 7.5.5. Any ideas on how to get this dinosaur working as a removable drive?

6401. Atari ST in New Jersey

Newsgroup: comp.sys.atari.st
Date: 2000-05-29 00:00:00 UTC
From: Liza Trent Savory <liztrent@earthlink.net>
Message-ID: <3931E3C3.1C41E911@earthlink.net>
Source record: 61575

Hello All,

I've recently returned home after being away for two years and re-discovered the Atari ST 1040s living in my attic. These are very basic, 1-meg machines, two of them, two color 1224 monitors and a B&W 124 monitor. I also have scads and scads of old software for these computers as well as come MAGIC Macintosh Emulation software which I have never used and do not understand. I beleive a dongle is necessary to run these.

Anyway, I dearly love these computers and find it very difficult to cut one more tie in my life to the old Atari legacy, but I think the time has come to free up some space and offer these systems to someone else to enjoy.

I would be very happy to pass these computers along to anyone who has a strong appreciation and understanding of the systems. I can not give them away to someone who does not not really have any interest in them except for the fact they are free. Please, serious enquiries only.

Also, please, do not write back to the address above. This is my mothers email. Please contact me at card_catalogue@hotmail.com. I am located in Northern New Jersey and will be happy to arange a mutually agreeable pick up or delivery. I will not ship them under any circumstances, so please, local inquiries only.

Thank You,
Jon Savory

Upcoming versions of HDDRUTIL (which is included in the HDDRIVER
package) will support the creation of FAT32 partitions when partitioning
a drive.

You might try Turbo ST, which I think is kind of Warp9 before the
Codeheads got hold of it. I don't know how buggy it is, but it will
give you a pretty good idea (a really good idea) what a software
screen accelerator does.

> 1.) Is it possible for me to partition, or will I have to reformat
> entire drive with HDX or HDriver?

Partitioning is sufficient. There is no different format for different
platforms, i. e. simply creating new filesystems (which is done when
partitioning) is enough for any cartridge or drive.

> 2.) Can HDX (v5.03c) format a drive of this size?
> I think I would prefer to use my standard AHDI 6.05c.
> Mostly because of cost.

AHDI doesn't support SCSI drives larger than 1 GByte. You might be able
to format the drive but HDX or AHDI cannot correctly access any sector
of a SCSI drive or cartridge beyond the first GByte.

Nothing special is required for HDDRIVER to be used with this drive.
Maybe some settings are wrong. I recommend referring to the parts of the
HDDRIVER manual dealing with removable media drives.

As an aside, a useless little snipped of info - Turbo St was the
competition to Darik Mihoka's (I really think I may have stuffed up
spelling his name there) Quick ST, which became Warp 9 after the
Codehead's got their hands on it.

Daniel has written for various printed Atari magazines.
Not that a software sinclap random string generator
(or its human equivalent, a sad individual with excess
vacuous air space between the ears) would know.

>You're no Rodney
>o'Lain!

He's no sinclap random string generator either.

Hey, here's an idea... We could install a copy of sinclap RSG
on Macgorilla's server, and, provided it can handle the high
volume of puerile nonsense it would generate, the site would be
absolutely bursting at the seams with "original" (but utterly
useless) content.

I used to run Turbo ST and was most happy with it. At some point I ran
into a software conflict with it, but can't remember what it was with.
I then switched to Warp 9 until I got the CD II and NVDI-ET4000.

The Warp 9 and Turbo ST are small packages (fit into an A5 envelope).
If anyone is interested I have both for sale. Email to
phil@digital-print.co.nz.

Regards

I think Warp9 is discontinued nowadays. NVDI was and still is far superior.
NVDI has the added advantage of replacing GDOS or SpeedoGDOS. This means
that it allows you to use TTF fonts and GDOS drivers for printing.

I think NVDI is at version 5 nowadays.

Do you mean Cabdload ? This is definitely NOT an ftp module. To use the
Cab's ftp capability, one just need to 'left-click' on an 'ftp://...'
url with NO ftp client installed. And sometimes use the proxy server.

Hope this helps.

Although the original 520 ST's (external power supply, no floppy)
did not have RF modulators, the later ones, at least in the USA did. They
had "520 STm" on the label on the back of the computer, but the emblem on
the front just said Atari 520 ST.

And the "added" drawback of - beginning with version 4 - a quite heavy
memory usage, even without a font cache. Just comparing the binary sizes
will already give you an idea.

Ciao

Hi Sean,

Not sure why they provide HSMODEM 6 and not 7.Anyway,HSmodem 7 is more
stable as there are a few bug fixes in 7.

Hello everyone,

Small question about the HSMODEM suite and ASH. I've noticed that with
all my ASH Internet software they include HSMODEM 6 not 7 for some reason
- this includes some recently bought software too.
Does anyone know the reason for this? I use 7 with RSVE and as far as I'm
aware not had any problems with it so was wondering why ASH distribute
version 6 with it's software.

Thanks in advance.

.....Thanks very much (Merci beaucoups to Monsieur Bales...) for all
the information on my little problem. As it turns out when I looked
closely at the box What I have is an FM (I told you my eyesight wasn't
much chop, didn't I.....) and yes it does have an RF out I'll try this
as the easy option first but thanks to Nic for the link from which I've
saved all pertinent information. I owe you all a drink, my shout next
at the bar.
Cheers J.

thanks, Shiuming, for pointing that out. But of course, the sinclap
random string generator seems to be unable to hold and use such
information, instead utilizing the same FUD it was programmed with in
1992 over and over.

>
> >You're no Rodney
> >o'Lain!
>
> He's no sinclap random string generator either.

Speaking of the SRSG, notice that there's still flaws in spelling
even after Service Pack 4 was installed - it's spelled "Rodney O. Lain".
Who, ironically, also writes for the MacAddict site, which the SRSG has
attacked on at least a couple of occasions due to its Steve Jobs
Reality-Distortion Field (tm) - free content (ironic that it would
attack a pro-Apple site). Perhaps something broke when the newest
version of AppleScript was installed?

When is Service Pack 5 coming?

> useless) content.

strangely, speaking of "parroting others with no original content",
isn't it ironic that the SRSG, in spreading its nonsense, goes and grabs
official Apple press releases and articles from other web sites
(formatting them badly in the process) without actually checking them
for content?

>I did that and just kept my account information. It booted up fine
>saying v1.20. I went into the Sting accessory and it said the dialer
>version is 1.16 and sting was 1.20. Aren't they supposed to be the
>same version?

No, the dialer is a separate program, which is why its given a different
no.

>So I went to load newsie but it keeps on frezzing up, not just on
>newsie on every program I load.

I don't know that it's a Sting problem, try disabling accessories and Auto
programs. If you've upgraded Newsie to v0.96, that bombs a lot on my
machine (I've gone back to v0.94).

>Surely I need dialer version 1.20 don't I, which it states in the help
>files.

No, I have dialer v1.16 and Sting v1.22 and it works fine for me.

Cheers!

Hello all:

I was reading posts from Atari-Midi (mailing list) when what to my mail box should appear: "Your site is in Keyboard magizine this month". I was in a state of shock.! Keyboard actually talks about ATARI?

About 3 months ago I sent Jim Ainkins a letter telling him of my site.No response. Now this! It is in the JUNE issue which should hit the stands this week.Have not seen it yet, but will check it out once they hit the stands.

I actually think this is a small "milestone" for us Midi-Atarians . Keyboard never talked about Atari for Years and Years, and now we have some coverage. What do you think?

Anyone using MagiC on a PPC Mac. Actually a 4400/200 Mhz. running Mac OS 8.6.
I can't get Iconnect to use the Remote Access, it keep asking for a STip program, and that didn't come with my disk.

Iconnect works fine with the old Mac OS 8,1 using FreePPP.

BTW. I keep getting a error message when starting MagiC, but most MagiC friendly apps works anyway,- anyone explain this?

cheers

Joergen

That's correct, FAT32-partitions must be set to F32.

> However Magic then says that the drive is invalid, even after a cold
> boot with the F32 cartridge in the drive. I suspect that something has
> to be switched on in Magic, in the same way that VFAT partitions have
> to be turned on.

Possibly, I have never used this feature in MagiC so I really can't
say. It would be weird if this was correct though, as the entire idea of
setting the partition type to F32 is to ensure that the OS use the correct
filesystem. E.g. under MiNT you have MNX, LNX and F32 which are
automatically recognised as MinixFS, ext2fs or FAT32.

Hi

Hey sounds interesting. Good to base in HTML.
I think the main thing we want is some pages with a good news section,
with news of new software/hardware bang up to date. Getting the
sellers, like System Solutions, or straight from the people who make
it, to send a little bit of info on forthcoming projects.

And when someone gets a new bit of software good or bad just take a
bit of time out and send him a review. Jinnee for example. It looked
great back in AC but it was a preview only, they never did a review.

If I wanted to buy it I would have to ask someone on this NG with it
to tell me if its good.

Hi Michael!

I get that too under Sting/MagiC 6! Also my Falcon doesn't like the
sub-menus, where the machine just freezes if I try them.

Also I get a crash when I try to download mail!!! :(

I reported these problems to John Rojewski, whilst v0.96 was in beta, but
they don't seem to have been fixed for the full release.

It's too bad. I've had to go back to using v0.94. :(

Cheers!

James

Mario,

I build a simple interface between an Shortwave radio and an Atari ST
many years ago (1992) based on information from Gary Sargent who
uploaded a shareware program to GENIE. The circuit used a 556 phase
lock loop and a LM324 buffer amplifier. I assembled the circuit and
demonstrated for our local Atari user group (WAUG). Unfortunately
the shortwave reception was very poor in the club house. As a backup
plan I had recorded on cassette the weather satellite broadcast at
home prior to the demo and patched the output from the tape player
into the circuit. It worked just fine (the weather map was only
taped delayed).

Below is some brief info from the author:

> GETTING THE PROGRAM
>

If you can afford it I've noticed that alot
of data-grade LCD front-projectors
[like those from Samsung] have TV/
LD/DVD/VCR inputs
(Composite & Svhs) but that even
the computer monitor input [DB15]
goes down to the 15khz needed for ST low
and the lowest cost one [a Samsung]
is under two grand but only has a Max
of 640x480 but enough if you want
to supersize your GEM screen.
You'll still need a switcher like
Omniswitch or similar.
[just an idea]

I only mentioned such as I'm considering getting one
instead of buying another RPTV to watch my movies
on and going downgrade to a 36 or 32 inch TV for
everyday viewing.

Did everything get replaced? I mean everything? Only Dial.scr
and Default.cfg may remain. Also, I wonder what is happening
with the IP number bit...try connecting at a very low speed and
see if it is stable -- if so, that would hint at HDdriver.

Hello Henk!

HR> Commandline typing started when a electrical typewriter
> (teletype or telex) successfully connected to a computer
> for the very first time. At the same time there were
> already people hating repeatedly typing the same Those
> people punched their commands in cards or in paper tape.

Of course, you can often use a command history on a
teletypewriter which makes life a bit easier. I recall reading that the slow
speed of ttys may have contributed to the 'terse' nature of many unix shell
commands.

HR> Before that, computers were operated by flipping switches.

Perhaps that's the real start of bloat-ware... once the
programmers didn't have to throw many toggle switches for each word of memory
they entered, they may have lost a big incentive to write small, efficient
code! <grin>

Seriously though, I think there is definitely a place
for command-line interfaces. They're ideal for scripting, and require *much*
less in the way of system resources than graphical user interfaces. Also, I
can't help wondering if the conversational nature of CLIs make them more
appropriate for text to speech setups than other interfaces.

Groeten,
- Andy.

>
> Before asking questions, first read all the news. Somebody may have asked the same
> question and the answer may already be there.

Agreed. But often I've noticed that a discussion will often drift from
the original subject. And sometimes the subject is not truly very
descriptive of the discussion. Even now, we are not discussing the
FAQ's themselves.

> This will also give a good impression of the spirit of the newsgroup.

Yes it does, and I must admit, my impression of the newsgroup, regarding
helping others, is not particularly favorable in the way the questioners
are responded to.

A new question, should a new person read _all_ the news or just scan for
what he wishes to know?

>
> > 2) You
> > don't know how to find them, because you are new and do not know that
> > the authors of the FAQ's have the addresses in their signatures.
>
> While reading all the news, you cant miss that.

Yes, but the authors do assume the reader will connect the two pieces of
information, there usually is no verb that connects the two or more
phrases.

>
> > 3) You
> > don't know how to access them even if you are successful at downloading
> > the file to your computer?
>
> Is it that difficult?

For some, it is. I once knew a woman who was sent to DOS classes
THREE times and still could not format a floppy. Yet she was very
bright and intelligent. I've noticed that people have the tendency to

feel that because something is easy for them, it should be easy for all.

Well...Warp 9 was a decent competitor to NVDI 2/3, which was its
competition. Neither program is 100% compatible with software,
and you definitely notice when the accelerator isn't running
(everything's so...sluggish without it).
Nowadays NVDI 4/5 is recommended by most who want a software
accelerator.

If the new user is following good Usenet netiquette s/he will have been
reading the ng for a couple of weeks prior to posting and will have read
posts by the FAQ maintainer and noted the FAQ location.

As for your next question: how do they know about netiquette? Subscribe
to news.announce.newusers for a month. Or read any book about starting
on the net.

Yo Don,

SLM-605 Atari Laser Printer was produced by Epson.

It is the same as the Epson EPL-6000 Laser Printer (Action Laser).

The Epson part numbers are:

IBS-301 Drum and charger unit 10,000 pages
IBS-300 Black toner cartridge 1,500 pages

Epson

800-873-7766
800-445-5054
www.epson.com

310-782-2600

You can special order from any Staples through there in store catalog.

6456. Getting weather satellite images on ST

Newsgroup: comp.sys.atari.st
Date: 2000-05-30 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <FvCw2C.5H@gem.win.co.nz>
Source record: 61524

I am posting this message on behalf of a local Atari ST user who would like to retrieve images from weather satellites and display them on his Atari ST computer.

He already has the relevant radio and modem equipment and uses this with his ST for packet radio. However he does not have any software for decoding the weather satellite images.

The only information which I have been able to obtain is that these images are in a "16 greyscale fax format."

I remember seeing an article on a system like this in a STart magazine from some years ago, but I don't know which issue it was, and in any case, that commercial system is probably no longer available.

Any advice on where to get suitable software for this purpose would be much appreciated.

> or Intel.

Once again, since this is obviously not yet clear: It doesn't make any
sense to format a medium or drive in order to use it on another computer
platform. This is a waste of time. The result of formatting is always
the same regardless of the platform. This is because formatting is an
operation completely done by the drive, without any dependency on the
platform where the format operation was started.
The platform-dependent data are created when partitioning the drive, i.
e. when creating the fileystem. They are *not* created during the format
operation.

I fail to actually see the link between the two events, but never mind.

> When someone asks a question in this newsgroup or any other newsgroup,
> any person who responds to the question is assuming the role of a
> teacher. I believe you incur some obligations when you take on that
> role.

I disagree with this. A teacher or hotline tech support person is actually
paid to do that. That is his full-time job, and has both moral and legal
obligations to do his job properly.

On newsgroups, people are taking on their spare time to help out other
users. This is free service that they do for the fun of it. You don't get
paid for helping people out in newsgroup, and even if you do get some
satisfaction from doing it, it eventually rubs off once you've answered the
same question 15 times.

> People, or students, ask a question when they do not know the answer.

Yes, but usenet is not a classroom. You must not assume that people on
newsgroups are there to help you.

> A _good_ teacher never assumes his or her student is in possession of

> necessary knowledge.

From what I've understood, there was only one person who didn't understand
that the URL of the FAQ was in my sig. I don't think we need to generalize.

> In the years past, when we actually had a computer company making
> hardware, the official online home of Atari was Genie.com. In those
> days, in the discussion groups, you repeatedly saw the same questions
> repeated. And they were patiently answered, as we knew these were

> unfortunate that some who reply to questions here do not seem to have
> this feeling of patience towards new and/or returning users.

Genie was only in the US, right? The difference is that on Genie there were
people from Atari Corp. who were actually paid to go there. There were also

dealers, etc... who had a vested interest in helping the community.

> If the remaining Atari users truly wish to see this platform survive, we
> have to do more than be curt with our replies. If you alienate a new
> user with your reply, do you think that user will want to keep his Atari
> computer, or move one to a Mac or Windows machine?

What's alienating about be told to RTFM. I get told this regularly when I
ask about some other topic, and I don't get my knickers in a twist about it.
It's the normal procedure to look for FAQs before asking for help.

> > : I've always believed that no question is stupid when you don't know
the
> > : answer. And to be made to feel stupid by having a question answered
> > : with something useless like "Read the FAQ (but I'm not going to tell

>
> Let me ask a question about the FAQ's. How do you know a question has
> been answered in the FAQ's if: 1) You don't know the FAQ exists. 2) You
> don't know how to find them, because you are new and do not know that
> the authors of the FAQ's have the addresses in their signatures. 3) You
> don't know how to access them even if you are successful at downloading
> the file to your computer?

1) There are FAQs on just about anything. You must first assume that there
is a FAQ. Do a web search or read the group for a few days before posting.
You'll learn a lot.

2) If you see the .sig, you see the FAQ. I don't see how you can actually
read a post without seeing the URL of the FAQ in the .sig. Besides, there
are search engines.

3) If you can click on a URL, you can both download the FAQ _and_ read it,
or am I over-estimating the average computer users mental capabilities.

> I agree 100% that directing someone to the FAQ is helpful. My position
> is that the way in which it is done less than friendly and helpful.

Why not do it yourself then? Don't forget to say "please" and "thank you".
Come on, I'm not saying that being polite is useless, but that online
etiquette has more to do with getting a clue before going "live".

> can be read as patronizing, and a new user may wonder why he/she even
> bothered to seek help. I have noticed that Mr. Bales has moved the
> location of his FAQ to the body of a couple of his replies. This is
> definitely more helpful, IMO, than just putting a location in his
> signature file where the questioner may or may not conclude that the
> answer to the question can be found there.

Have you seen my .sig ? It's difficult to be clearer than this:

```

Hi!

Computer Shopper although mostly a PC magazine have a section on
Ataris near the end along with Amiga and Acorn. Julys issue this year
has got demo of Calamus SL on. It may not be an Atari magazine but
they do realise that there are other computers other than PC and Mac.
Quite big sections on Linux as well.

Oh yeah, Computer Shopper is the biggest selling computer magazine in
th UK.

In article <3932F8EE.B8282431@greeleynet.com>,
wordworks@greeleynet.com wrote:

I cannot understand what the fuzz us all about. If you have asked a
question and not have discovered that the URL to the site you are
advised to check out is found in the signatur, then you have not read it
carefully enough.

If you ask for help and get a reply, at least show enough respect to the
guy taking the time to answer to at least read the answer carefully.
Maybe some newbies will need more help than the FAQ can give, but then
just ask again.

I don&#65533;t mind helping out when I can, but I think this thread is getting
silly. Appreciate that someone has taken the time to answer all these
questions and made them available. I have asked real newbie questions
and do not mind to be redirected to the FAQ. That is what it is for.

6462. English RSC file for fiffi 1.20 update

Newsgroup: comp.sys.atari.st
Date: 2000-05-30 00:00:00 UTC
From: Derryck Croker <derryck@NOSPAMcix.co.uk>
Message-ID: <959700516-359185AEicMi@cwcom.net>
Source record: 61530

Hi all,

Thanks to Sean Barbieri for both pointing out and giving a cure for a bug in
DDP's English RSC file for Fiffi 1.20.

Delete form 8 from the English RSC ("Session active, should it be closed") and
replace it with the same form from the German RSC, translate it as required.

Alternatively there's a ready-rubbed version on the website.

The bug prevented that dialog box from closing if the closer box was clicked
(or the menu item clicked).

If you have a copy of it stored on your website for download, please replace
it with the new version.

Have you tried including the line

;#_TSL <non-preemptive>

in your magx.inf file? It turns preemptive m'tasking off. Once MagiC is
loaded, fire up the timeslice cpx and tick the Preemptive box and save it.
This allows all your stuff (including desktop?) to initialise properly in
turn.

The latest is issue 78 (the original STApplications had been going for a long time).

There's plenty of news, most of which I guess we know about, and an article about CD writing on the Atari.

Not a lot you might say, but magazines do depend on writers.

I think this is what gets easily forgotten: Usenet newsgroups are
/discussion forums/, not help desks. Some people seem to have missed
that, and expect a premium 24/7 support whenever they have a problem and
post about it - and even have the guts to complain if they're just told
to read a FAQ or the FM.

Ciao

Thomas

>(<2.06).

Correct. And the darned thing crashes with Dennis' method of termination as well - at the next attempt to run a program I get a SYSTEM HALTED message. I agree that this is Harly's fault - it's just that I find it invaluable for some tasks, specially editing binaries. I guess the asnwer is not to terminate it but leave it there - with 14 MB RAM it should not matter too much. BTW, what exactly does freezing a program or accessory do? Does it free up any memory, or only ensure that the CPU does not waste any cycles on it?

Hi

this isn't a bad mag, apart from the usual; 80% being adverts.

The author of the Atari section does seem to be bias to specific things,
companies and services. It's a pity it could be an excellent section.

Mind you any coverage is better than no coverage:)

There is:) It is/was a commercial program that came with the hardware
for satellite reception etc.

The program runs in HI res and I couldn't get it to run under 2 meg of
memory. I can't remember the title off hand and I should have it in my
Archive somewhere!

Hello Rick!

RI> I need to find a way to read Atari 520ST disks
> into a Mac or PC.

Get some double-sided double-density (DSDD) 3.5"
disks, format them on the PC as 720 Kb and they should be useable on the PC, ST
and most Macs that have a floppy drive. I tend to format disks from the DOS
prompt with the command...

FORMAT A:/T:80/N:9/U

Hope this helps.

Not sure how much help this will be, but if you happen
to have a PC laying around you could squirt the files in question over to that
and then just...

ATTRIB -R *.*

...from the DOS prompt. If anyone knows of a similar
command for TOS then I'd be interested in hearing about it. I don't have the
facilities to write one just now, but perhaps someone in this conference does.

Regards,
- Andy.

Hi Dennis.

On their page Milan still mentions Papyrus as the bundled wordprocessor. I know that it has been discussion on which wp for tyhe Milan but is it for sure that Tempus will be the chosen one? I haven't used Tempus myself and don't know much about, can you point me to a place where to get more information about it? Can it export and import MSword/RTF/HTML as Papyrus does? What are its other "pro" features? Sounds very interestig as Papyrus its already a great package, so if Tempus is better, its got to be really cool.

Daniel.

I believe it's to do with Mac OS 8.5 and above .... I was led to believe upgrading to the latest version of MagicMac solved the problem, I didn't bother.

> BTW. I keep getting a error message when starting MagiC, but most MagiC
> friendly apps works anyway,- anyone explain this?

It's to do with the memory allocation in the setup .... that's as much as I can tell you. I have the same but everyhting ran as you say so I just ignored it. I've just sold my copy of MagicMac as I no longer use it hence I wasn't going to upgrade it.

8~) Brilliantly put, that says it all.

Someone elswhere mentioned that these groups are not here to answer newbies questions, i beleive thats crap, i thought that was exactly the spirit of these groups, thats certainly why i hang around our club's mailing lists.

I think the keepers of the FAQ's are too full of themselves, too self important, perhaps they should just take a back seat and let people who /are/ willing to help do just that, maybe they'l pick up some pointers on how to properly deal with people who have queries.

Even on the most ancient Atari, clicking a TXT file will bring it up in the
internal "more" clone. Nothing could be easier.

// > What systems are people using Magic on? I've heard that on ST's,
// > Magic is quite stable, but on Falcon's, it's not nearly as stable. I
// > Mike Freeman

I have no CT2 for it to screw up. At bootup, it goes through the ICD utils, does the LILO check if I want to run linux instead (usually not), and then it will start the MGx boot... I would say 3 to 5 out of 10 times I will get the STHigh screen and nothing more. Pressing the Falcon reset switch then allows the bootup to resume (resumption is a nice feature, I must say).

I admit to being dissapointed with magic--running phasar (as a single, most TOS-friendly, of course) out of turn corrupts mgxdesk (and dumps everything, allowing me to coldboot). I'd write a newdesk-bootup switcher, but everytime I get a compilation error in lattice I get an XFS-something or other error, and get to reboot. If I have an error, I get to practise my german. (In deferrence to the German users, I'm sure getting to practice english in mostly- or english-only prgs isn't a favorite pasttime)

The option is, of course, get mint and wade through the documentation--again. Figure out which aes replacement is best I HAVEn't even begun to consider, since I still haven't gotten through the docs.

OKAY, my rant is over.

... every day a new instrument and a new method is invented.

6491. Announcement: ST Plus

Newsgroup: comp.sys.atari.st
Date: 2000-05-31 00:00:00 UTC
From: Simon Osborne <simon@polarnet.f9.co.uk>
Message-ID: <pBcZ4.2717$J5.138470@stones>
Source record: 61409

ST Plus is coming back! This time, not paper based, but it will be an online magazine.

I have setup a mailing list for discussing the mag, and to generate interest and feedback. If you wish to join, send an email to stplus-subscribe@egroups.com

I am hoping to have the site online by the end of June. There will be no release dates or deadlines to reach because the site will be updates as and when news happens. I feel the Atari scene lacks a definate source of information and reviews.

For those that don't like to read online mags, because of phone charges etc, I will be giving the choice of a weekly email digest with all the weeks news.

Please let me know your ideas and views, and if you have anything really important to say, why not join the mailing list?

I want this to be a success!

Simon Osborne

Yes, I do belive it has to do with the OS on the PPC, where I am using
MacOS 8.6 and APPLE Remote Access at the moment, on the "old" Centris
with MacOS 8.1 and FreePPP, there is no problem with connections.
And I am usng the latest MagiC Mac, version 6.01, I belive.

Then I have to fiddle some more with the setup when starting MagiC, I
think.

cheers

Given the number of scholars (many of which are supposedly native
speakers) who still confuse most of the above, the question does
have its relevance.

On a Hades there is HDDriver with the generic SCSI-driver enabled.
When MagiC starts the SCSI function of HDDriver are not seen.Tose are
needed by the driver for de CD-ROM.
Starting the stand-alone scsidrv.prg from MagiC makes the functions
available.

Is this known behaviour?

This is a interesting point. Of course DOS is made by a dummy for even dummier.
Being bright and intelligent works contra productive. You dont need to do a DOS
course to know that you dont want to be constantly offended by a dead piece of
material. Apart from being bright and intelligent, the poor women must also have
been extremely coï¿½perative. I hope she is still well.

In California at least, many of our international graduate
students come to us with nearly no knowledge of English. They
get a crash course in the language upon arrival, but often
graduate without achieving English fluency. This only is of
interest to me because for some $#%&$* reason they give these
guys classes to teach in English! Very irritating if you are
one of the students.

I wasn't around for the days of 75 and 300 baud modems, but I do
recall that I could read text faster than my 1200 baud modem
could display it (300-400 WPM). At 16 times slower, every
character must have counted back in the old days.

2.06 is the best the STe can handle -- you can add software OS
parts (Mint, Geneva, Magic, etc.) if you have a hard drive.
Do you have the STING.INF file pointing to the STING folder?

I had (in fact, I still have) a similar problem. Sting froze or bombed
almost every time, sometimes in initialization, sometimes when I
tried to activate Newsie, Cab, or anything else that used Sting.

Try replacing STing's SERIAL.STX with an older version. On my computer,
STing kept crashing time after time, but when I replaced (after much
experimenting) SERIAL.STX V1.20 with SERIAL.STX V1.15 everything was
OK again. So: just older SERIAL.STX, everything else from STiNG 1.22
or 1.22 is ok.

Some experimentating with a terminal program (STarCall) showed that my ISP
had several nodes, (with different phone numbers) which responded differently
during logon (as if they used two different applications on their nodes).
It turned out that STiNG (with SERIAL.STX V1.20) worked OK with one of them,
but regularly crashed with another.

I contacted U.R.Anderson about this, and his opinion was that at some point
an illegal content arrives after logon, and Sting can't handle that.
But he was baffled as to why the old version of SERIAL.STX was tolerant of
this while the newer ones were not.

Cu.

Yes, this is exactly my problem, too.

>I admit to being dissapointed with magic--running phasar (as a single,
>most TOS-friendly, of course) out of turn corrupts mgxdesk (and dumps

I am quite disappointed by MAGXDESK. I can't for the life of me
figure out how to use the Install Application function, or to assign
icons to programs. When I try to do what the puny, unhelpful 39-page
manual says, the APPLICAT program ends up crashing or something. I
also don't like the fact that you can't change the names of program
icons on the desktop, like every other desktop (even GEM) allows you
to do. Fortunately this can be solved by getting Thing or Jinnee.

>The option is, of course, get mint and wade through the
>documentation--again. Figure out which aes replacement is best I HAVEn't
>even begun to consider, since I still haven't gotten through the docs.

I've gotten a very simple Mint/Geneva setup going that works quite
well, and I didn't even really need to read the doc's much. Geneva
comes with a sample MINT.CFG file, and you just edit the file paths
and put MINTNP.PRG in AUTO and MINT.CFG in MINT folders and you're
all set! I love Geneva. It's extremely stable and compatible. Much
more so than Magic.

I still like Magic for it's speed and appearance, but I'm still not
convinced that it's not the most buggy OS I've used on my Atari (I
haven't used NAES, so I can't comment on that). I've seen more
crashes and programs that won't run on it than I care to.

6511. Hybrid Arts Page UP!

Newsgroup: comp.sys.atari.st
Date: 2000-05-31 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8h48un$7k$1@nnrp1.deja.com>
Source record: 61429

I am happy to announce that my HYBRID ARTS page is now up!

Downloads include:

Ludwig
CZ-Android
GenEdit
EzScore Plus

These were released to me as FREEWARE by Tom Bajoras, a former member of the "legendary" Hybrid Arts Team.

The downloads were supplied by Jos of our List.(Atari-Midi) They are "Liberated "files, (and that is OK with the programmer) but Jos worked hard and took out those "type" of messages and actually put in "FREEWARE" So hands down to Jos!

I asked Tom B. for Electronic Docs, but he does not have any. I DID find a
demo version of CZ Android which actually is a tutorial. So run that first.
Very nice and "cute".

Tom B also released to me DX-Android, but I do not have a copy that is downloadable. ANYBODY?

Also..if anyone can write up a "short concise" tutorial on the basics of
GenEdit, it would be much appreciated. I found out how to do some things,
but if anyone has experience with GenEdit, I would really appreciate it.Give
you full credit of course.

See sig for the web sites. My mirror might be faster.

Enjoy these wonderful programs

I would like to invite any of you to the Atari-Midi mailing List. See Sig.

I've had a similar problem, in fact I went through a lot of config files and started to try to point them to A drive since they were all referencing C:. However no sucess and I get the same default.cfg problem.

Does anyone havce a way of pausing the error messages, they blink on the screen too quickly to see what the error is before returning to TOS.

I never make use of Wdialog. Fact is that v 0.94 works oke but v 0.96 is
really unusable, at least with N_AES. Under plainTOS it seems to work.
With v0.96 I can't for instance view the next mail/message. If I click on
next Newsie is killed. Furthermore accessing the menu sometimes do freeze
Newsie completely. There is obvious something terrible wrong with Newsie
0.96.

If anyone is looking for Toner for the SLM-605 printers, I purchase
the remainder of a dealers setup of this model and have alot more than
I'll ever use. I'm located in Jacksonville FL but could ship to
anywhere in the USA.
$5.00 per toner refill

There's no direct connection, this discussion was just one of the things
that came to mind over the weekend.

So, if a coworker asks how to do something on the job, you would not
consider yourself in a teaching mode?

> Yes, but usenet is not a classroom. You must not assume that people on
> newsgroups are there to help you.

But is it not an informal classroom? Is not information of varying
levels passed from one individual to another via the discussions held?

> We can assume that someone who found his way onto a newsgroup is quite
> capable of clicking a URL.

I wish this were 100% true, but it is not.

> From what I've understood, there was only one person who didn't understand
> that the URL of the FAQ was in my sig. I don't think we need to generalize.

There were two who fall into this category who were willing and able to
post about their ignorance. I was one. The original poster was the
other. We have no way of estimating how many others did not post, but
there has to be some who also did not understand the URL in the sig were
where the FAQ's are located.

::chuckling:: And I seem to be the only one left still willing to admit
their ignorance. <G>

> Genie was only in the US, right? The difference is that on Genie there were
> people from Atari Corp. who were actually paid to go there. There were also

> dealers, etc... who had a vested interest in helping the community.

Genie had a limited number of international access points. Had Atari
and/or Amiga survived, who knows what would have happened.

To my knowledge, there were no paid Atari Corp. employees regularly
posting or operating in the various discussion areas. At least not
during the 5 years or so I participated. There were some Atari users
who received free access to the service in return for running and
maintaining different areas, but they were definitely not Atari
employees. Dealers were there, but no more so than I've seen in the
newsgroup. Benjamin Smith posts more in this newsgroup than any dealer
I ever say post in the Genie discussion areas. By far and away, the
help was provided by users of the service, just as you do here in the
newsgroup.

FWIW, I had free access due to my involvement in a different, non-Atari,
discussion group for about 2 years before I left Genie.

> What's alienating about be told to RTFM. I get told this regularly when I
> ask about some other topic, and I don't get my knickers in a twist about it.
> It's the normal procedure to look for FAQs before asking for help.

It's the way in which they are being told, not the being told.

> 1) There are FAQs on just about anything. You must first assume that there
> is a FAQ. Do a web search or read the group for a few days before posting.
> You'll learn a lot.

Here in the US, there is an old joke about the word assume. "Assuming
something makes an ASS of U (you) and ME." And I can guarantee you that
I've made and ass of myself many times by assuming something. And I've
hurt people's feelings doing this.

> 2) If you see the .sig, you see the FAQ. I don't see how you can actually
> read a post without seeing the URL of the FAQ in the .sig. Besides, there
> are search engines.

Yes, there are search engines. And there are airplanes and trains and
other items. That doesn't mean I can successfully use or manipulate
them.

> 3) If you can click on a URL, you can both download the FAQ _and_ read it,
> or am I over-estimating the average computer users mental capabilities.

I will plead guilty of not having downloaded and read any of the FAQ's.
I've not needed them yet, at least I've not had questions for which an
FAQ exists that I know of. It took me a long time to understand the
difference between TOS and TTP files. I had no one to ask, not even a
dealer. So, assuming the FAQ is a text file, that doesn't necessarily
mean the person who manages to download the text file knows what a TXT
file is or how to access it. I don't think it's necessarily the mental
capabilities as it is lack of knowledge. On Windows machines, TXT files
are automatically linked to the notepad accessory. And these days, the

file extension is usually hidden from the new user. So even tho', on a
Windows machine, the user gains easy access to a TXT file, put that user
on an Atari where a TXT file must me manually associated with a file
reading program on an old Atari, and the user will probably be lost.

> Why not do it yourself then? Don't forget to say "please" and "thank you".
> Come on, I'm not saying that being polite is useless, but that online
> etiquette has more to do with getting a clue before going "live".

I have occasionally done this, but usually someone else has already
passed along more information than I have at my disposal.

> Have you seen my .sig ? It's difficult to be clearer than this:
>
> --
> ||| Nicholas Bales, Toulouse, France
> ===|||==
> / | \ The Atari ST Quick FAQ bales@
> -' ' `- http://bales.online.fr/atari online.fr

Yes I have, but as I noted in a different message, there is no verb that
actually ties "The Atari ST Quick FAQ" is located at
"http://bales.online.fr/atari". A statement that is more helpful would
be "You can find the Atari ST Quick FAQ at
http://bales.online.fr/atari". You now have a sentence that connects
everything together.

My mother is a retired English teacher who tutors foreign students in
their English at the local university. If you were to present your sig
file to her in a paper you were doing for a class, you would find it all
"marked" up with a suggestion or two! ::laughing in fun:: She has even
shown a couple of professors where the professor was in error. She is
one very capable English teacher.

Hello

I just bought meself a 2md/3rd/whatever hand MegaSte, but im wondering if there is a good TOS and GEM for this machine, i mean what version is the latest. I saw TOS 2.06 at LGD, but maybe there is a new one and maybe there is just another and better OS.

I have a problem as well.
I would like to put my MegaSte on the internet through my P2, thus i have a null-modem cable from my STe to my P2 and my P2 is connected to a network that as acces to internet (got it so far?).
I downloaded STiNG, but it keeps asking for default.cfg, and doesnt work... con someone shine a light???

I'm not certain WRT the VGA cable, but in atari SCART cables, you add a 150
Ohm resistor at each colour wire.

The models with an M in their name has a modulator, that is STM and STFM, as
well as the STE.

>Does anyone know a source for a 13 ping male DIN?

I bought mine from Labbelektronik in Stockholm
(http://www.labbelektronik.nu/), but I think they had to order it from ELFA
(http://www.elfa.se/). Keep in mind that the DIN13 is one hard bastard to
solder, with all those pins hugging each other just waiting to build some
"bonds".

That's a good idea you have WRT making a new connector at the computer end. I
think I'll look into that.

I suppose that's SECAM specific, since all my PAL STMs and STFMs have
modulators as well as the standard 13-pin plug.

6530. Tosbox announcement

Newsgroup: comp.sys.atari.st
Date: 2000-05-31 00:00:00 UTC
From: Mark Slagell <slagell@cs.iastate.edu>
Message-ID: <393500B0.7B75C4BF@cs.iastate.edu>
Source record: 61483

Hi All,

Tosbox version 1.10 is available now. There has lately been some access trouble at the emuclassics.com site, so the new version was posted a couple of days ago to http://www.geocities.com/tosbox instead. The emuclassics site will be updated from 1.09 to 1.10 when that becomes possible.

Notes:
======

1. Shareware fees are no longer solicited; anybody can have a registration key upon request.

2. Sound cards that are marginally Soundblaster-compatible (insofar as they don't implement single-operator synthesis) are now better supported. An example is the onboard sound of the FICA VA503A motherboard.

3. A bug affecting the GFA BASIC 3.x linker was fixed. This is actually a re-fix of a fairly old CPU bug that somehow crept back into the code a few versions ago.

4. For Linux/dosemu friendliness, a new mouse type was added. When dosemu is invoked as an X-windows application (xdos), it has the quirk that whenever the mouse pointer leaves and re-enters the emulation window, a single pair of bogus coordinates is reported by its internal mouse driver followed by correct coordinates. The errant reports are filtered out if you choose mouse type "Linux/dosemu" in the setup program or manually edit the init file to use type 4.

Those and a H*** of a lot more. I've heard that English is the hardest language to learn as a second language because it breaks so many of its own rules. But I'd think the oriental languages would be just as difficult if not more so since the meaning of a word often depends on the tonal character when spoken.

Hello Greg!

GG> Any chance you could give me some pointers on ram
> upgrading? I guess I might as well since ST's are
> a fun machine... but are even better with 4 meg. :)

I believe 4 Mb is possible on many of them, it may be
easiest on an STe where you can plonk in some 8-bit 30 pin SIMMS, but I'm not
sure of the exact spec required.

I mostly upgraded STFMs. I added a third party memory
board to one and put two 1 M x 8 bit (perhaps 9 bit, but I expect the parity
bits were ignored) SIMMS on the board, which together with the machine's
original 512 Kb gave it about 2.5 Mb, nice for RAM drives.

I upgraded a couple of other STFMs with chips that I had
laying around in my scrap box. One took a bank of (presumably 16) 256 K x 1
bit DIL chips to make a 1 Mb ST. The other was even nicer and used (presumably
4) 256 K x 4 bit DIL chips, again resulting in a 1 Mb machine.

Regards,
- Andy.

>

Yes, a device called a caTTermaran. I think it gave the TT a 40MHz CPU, or
50MHz, can't remember

Simon

> Was such a thing ever made?

The CaTTamaran was made in the Toronto suburb of Richmond Hill.
Here's a FAQ they once wrote about it:

8x---------

Frequently Asked Questions
about the
CyReL CaTTamaran TT030 Accelerator

Fifth Edition

Release Date: July 8, 1994

Note to the readers of previous editions:

Additional Q&A paragraphs have been added throughout
this document. To view the changes from the previous
revision, please set your search pattern to '[5]'. All other
readers are advised to peruse through the entire documentation.

/// What does the CyReL CaTTamaran TT030 Accelerator do?
==========

It will speed up your Atari TT030, giving you approximately 50% more
performance than a regular TT. It does this by speeding up the main
clock of your TT from 32 MHz (standard) to 48 MHz (accelerated).

/// What happened to the 40 MHz mode? [3]
==========

Originally, we thought the optimum we could achieve would be a TT030
running at 40 MHz. However, during the development of the CyReL
CaTTamaran we discovered that we would be able to go all the way up
to 48 MHz instead. Thus, the decision was made to drop the 40 MHz
mode and provide only the 32 MHz and 48 MHz modes.

/// Does the CyReL CaTTamaran replace the MC68030 CPU in my TT?
==========

No it does not. You do not have to purchase a new CPU.

/// Will the CyReL CaTTamaran speed up the FPU operations? [3]
==========

Yes it does. You'll get up to 60% more FPU performance with the
CyReL CaTTamaran.

/// Do I have to get a new FPU? [3]
==========

No. You do not have to replace the CPU nor the FPU. You simply keep
the components you have.

/// Has the CyReL CaTTamaran any Cache memory? [2]
==========

No it does not. The CyReL CaTTamaran utilizes the existing memory in
the best way possible while keeping the cost of the unit down.

/// Do I have to buy new memory?
==========

No. You do not have to add costly cache memory to your system. You
simply keep the memory already installed in your TT.

/// Do I get a higher performance factor with faster RAMs ? [2]
==========

No. The CyReL CaTTamaran does not access the RAM itself. This is
being done by the CPU and the Atari TT chipset. Thus, the CyReL
CaTTamaran cannot take advantage of faster RAM chips. However, we
have optimized the memory accesses, thus giving you up to 78% better
access times than the regular TT chipset will yield. [3]

With a small modification, GE-Soft FastRAM boards can be optimized
for the operation with the CyReL CaTTamaran. Test results obtained
with GEM-Bench show that FastRAM access speeds can go up to 220%.[5]

/// Does the CyReL CaTTamaran work with FastRAM?
==========

Yes it does. So far, we have tested the CaTTamaran with FastRAM
modules from GE-Soft and Atari.

/// Have there been any problems with FastRAM boards? [4]
==========

One customer reported that he was not able to get some older GE-Soft
boards working correctly with the CaTTamaran. Another reported
problems with a fully loaded 64 MB GE-Soft board. Some of these
troubles can be eliminated by using a higher rated power supply,
especially if the system has already been equipped with an ST-RAM
board, TT-RAM board and/or a graphics card. There are also some
'fine tuning' instructions available from Cybercube to avoid such
problems.

Update: These problems have been eliminated. The latest CyReL
CaTTamaran revision now fully supports all TT-FastRAM sizes. [5]

/// Is there a 100% guarantee that it will work in my system? [3]
==========

No. We want you to understand that we cannot give you a 100%
assurance that it will work in every conceivable
motherboard/expansion board(s) combination. The CyReL CaTTamaran
employs a bag full of tricks to achieve the high performance level
it provides. We have exercised great care to insure the best
possible compatibility, but as with every other product, the risk to
its use and installation lies with the user. Please refer to the
ordering details and our return policy for more information about
this issue.

/// Will the CyReL CaTTamaran generate excessive heat? [2]
==========

No. During our extensive testing program we found that the heat
generated in the accelerated modes does not exceed the safety
limits nor does it damage any parts of your your TT.

Several design steps have been integrated to insure that the CyReL
CaTTamaran accelerator unit will run as cool and as efficient as
possible.

/// Will the CyReL CaTTamaran cause any damage to my TT? [2]
==========

No. We have tested the full operation of the CyReL CaTTamaran and
included special design features to guarantee that the proper usage
of the accelerator will not cause any damages or malfunctions.

/// Does the CyReL CaTTamaran work with VME bus cards?
==========

Yes it does. But we can only guarantee the full compatibility with
our own line of VME bus boards, the CyReL Sunrise M16-1280 True
Color High Resolution Graphics cards, CyReL VidiMix16 Desktop Video
Modules, CyReL MPT-16 Modules and the CyReL TrIDEnt IDE Interfaces.

/// How can I find out if I can install a CyReL CaTTamaran in my TT?
==========

That depends mostly on your TT030 motherboard revision. To establish
which TT030 motherboard revision you have, you must open your TT030.
Please note that this may void your warranty. Once you removed the
cover (and any metal shielding), please check the lower lefthand or
righthand corner of your motherboard. Write down the revision level
usually found on a white sticker on the motherboard. For a quick and
easy installation, you should have at least REV. G.

If you have a ST RAM memory expansion board, please check whether
the pins of the frontmost 96 pin DIN connector stick out at least

3 millimeters (about 1/10 of an inch) from the topside of the ST RAM expansion board.

Further, please ensure that those pins are clean and free of any soldering residues. [2]

/// What if I do not find any revision index/label? [2]
==========

Several customers reported that they were unable to locate the revision level sticker as indicated in the Q&A paragraph above. Here are a few hints how to identify your board revision level without the sticker:

* please locate the CPU. Is it surface mount (soldered directly to the board) ? Look for a chip with the MC68030F33 labelling. If you locate this chip on the right hand side of the board (underneath the ST RAM expansion board) then you have one of the more recent board revisions. If the CPU is on the left hand side of the board or plugged into a socket, or even on a daugtherboard, then you have one of the older revisions. The installation in the older revision boards is a little more involved, since it will require some soldering.

* please check if your board has a three pin connector labelled W101 (used to change the clock speed of the FPU). If you cannot find this connector, you probably have one of the older revision boards.

/// Does the CyReL CaTTamaran installation require soldering?
==========

It does not necessarily require soldering if you have a motherboard revision REV.F or higher. Earlier motherboard revisions will require soldering. [4]

/// What tools do I need to install the CyReL CaTTamaran?
==========

You will need a Phillips screwdriver, a flathead screwdriver (both to remove the TT cover), pliers or any other tool to straighten the tabs of the metal shielding (if any) for removal and a cutter to cut one pin of a resistor.

For a installation in older TT's, you will require a soldering iron. [4]

/// Do I need any special expertise to install a CyreL CaTTamaran?
==========

No. Common sense is all that is required. If you know how to open your TT, plug in a few plugs, you should be able to install a CyReL CaTTamaran yourself. If you do not feel comfortable installing the unit yourself, ask your nearest Atari dealer to perform this task

for you.

The CyReL CaTTamaran comes with our highly acclaimed RUN-ME-FIRST installation program that will demonstrate each installation step with graphics and animations right on your screen BEFORE you start the installation process. The same instructions are also included in printed form to further facilitate the process. [2]

/// Does the CaTTamaran work with the older TT motherboard revisions? [4]
==========

Yes. We have just released a new archive containing a 150 dpi GEM image describing all the necessary modifications to install the CyReL CaTTamaran in systems with the older motherboards (those that had a CPU daughterboard). This file will be made available via several online services for your convenience.

Please note that we included a complete set of benchmarks (produced on such a system) below.

Update: The CyReL CaTTamaran can now also be used in systems with TT motherboard revision Rev. B (CPU is in PGA package in a socket on the left hand side of the board). [5]

/// Can I control the speed of the CyReL CaTTamaran?
==========

Yes you can. Each CyReL CaTTamaran comes complete with the CyReL Dashboard utility. This accessory program allows you to switch at any time from 32 MHz to 48 MHz or from 48 MHz back to 32 MHz.

/// How compatible is the CyReL CaTTamaran?
==========

The operation of the CyReL CaTTamaran if fully transparent. Programs do not usually notice any difference when running at 48 MHz. All programs tested so far ran without any problems. They simply execute faster. However, we cannot give a 100% compatibility assurance since it is virtually impossible to test every single program out there in combination with the hundreds of utility and accessory packages available for the Atari computers.

/// Which programs will benefit the most from the speed-up?
==========

The speed-up will be most apparent with programs that rely on CPU intensive tasks, like blitting, compressing, de-compressing, converting, rasterizing, scrolling. Since the CyReL CaTTamaran speeds up the FPU as well, programs that rely on FPU performance (like DynaCADD or InShape) will be sped up too.

/// How about some benchmarks? [2]
==========

Here are some PRELIMINARY figures. The benchmarks have been
compiled with Ofir Gal's GEM-BENCH Version 3.41:

```
GEM Bench v3.41 ï¿½ Ofir Gal 3.5.94
==========================================
TT 030 TOS 3.06, MiNT not present
Blitter not present, NVDI 2.03 present
Video Mode = 640 * 400 * 2 Colours
LineF FPU installed
Run and Malloc from FastRAM
Ref = TT + FPU, ST High
CyReL CaTTamaran @ 48 MHz
ROM relocated to FastRAM
NVDI driver installed
==========================================
GEM Dialog Box: 0.685 463%
VDI Text: 0.270 1618%
VDI Text Effects: 0.525 1381%
VDI Small Text: 0.345 1191%
VDI Graphics: 1.150 513%
GEM Window: 0.370 276%

New Dialogs: 0.990 355%
==========================================
Graphics: 643%
CPU: 145%
Average: 511%
```

Compared to a regular ST, the TT030 + CyReL CaTTamaran will deliver
a CPU Integer Division index of over 1760%.

/// How about some more benchmarks? [3]
====================================

Here is the latest benchmark update. The CyReL CaTTamaran can be
operated in two modes, 32 MHz and 48 MHz. In 32 MHz mode, the CyReL
CaTTamaran yields exactly the same results like a standard TT030,
reporting around 100% for all the different test categories.

Below you will find three different sets of benchmarks. The first
was taken on a TT030, equipped with FastRAM and the CyReL CaTTamaran
running at 48 MHz:

```
GEM Bench v3.41 ï¿½ Ofir Gal 3.5.94
==========================================
TT 030 TOS 3.06, MiNT not present
```

```
Blitter not present, NVDI not present
Video Mode = 640 * 400 * 2 Colours
LineF FPU installed
Run and Malloc from FastRAM
Ref = TT + FPU, ST High
CyReL CaTTamaran @ 48 MHz
=========================================
GEM Dialog Box: 2.990 106%
VDI Text: 4.015 108%
VDI Text Effects: 6.550 110%
VDI Small Text: 3.835 107%
VDI Graphics: 5.055 116%
GEM Window: 0.955 107%
Integer Division: 1.025 149%
Float Math: 0.145 160%
RAM Access: 1.185 160%
ROM Access: 1.165 128%
Blitting: 1.420 151%
VDI Scroll: 2.700 106%
Justified Text: 3.725 108%
VDI Enquire: 1.015 125%
New Dialogs: 3.075 114%
=========================================
Graphics: 114%
CPU: 149%
Average: 123%
```

If you have FastRAM and you use a ROM relocator you will get the following results. Notice the favourable increase in overall system speed:

```
GEM Bench v3.41 ï¿½ Ofir Gal 3.5.94
=========================================
TT 030 TOS 3.06, MiNT not present
Blitter not present, NVDI not present
Video Mode = 640 * 400 * 2 Colours
LineF FPU installed
Run and Malloc from FastRAM
Ref = TT + FPU, ST High
CyReL CaTTamaran @ 48 MHz
ROM relocated to FastRAM
=========================================
GEM Dialog Box: 1.945 163%
VDI Text: 2.780 157%
VDI Text Effects: 4.510 160%
VDI Small Text: 2.445 168%
VDI Graphics: 3.945 149%
GEM Window: 0.680 150%
Integer Division: 1.015 151%
Float Math: 0.145 160%
RAM Access: 1.180 161%
```

```
ROM Access: 1.180 127%
Blitting: 1.300 165%
VDI Scroll: 2.105 137%
Justified Text: 2.720 148%
VDI Enquire: 0.745 171%
New Dialogs: 2.100 167%
=========================================
Graphics: 157%
CPU: 149%
Average: 155%
```

The next benchmark shows the combined effect of a ROM relocator and a software screen accelerator, in this case NVDI. Note: these figures have been provided by one of our beta testers.

```

/// How much does the CyReL CaTTamaran cost ?
==========

The CyReL CaTTamaran package retails for just US $99.00 or Cdn
$115.00 .[3]

/// When is the CyReL CaTTamaran going to be available?
==========

The CyReL CaTTamaran is available now. Please contact your nearest
dealer, CyReL distributor or Cybercube for more informations. [3]

/// Do you have a list of dealers already supporting the CaTTamaran?
[4]==========

Yes. Here is the partial list (current as of the indicated release
date). You can order your CyReL CaTTamaran through any of these fine
dealerships or representatives:

North America:

Horizon Computers Denver Colorado
ATY Computers Oakland California
Mid Cities Computers Bellflower California
Toad Severna Park Maryland
Computer Studio Asheville North Carolina

Neutronics Honolulu Hawaii
CompuWorld Scarborough Ontario
DMC Publishing Markham Ontario
Scarborough Computers Scarborough Ontario
Cybercube Research Ltd Thornhill Ontario
Focus Computers Toronto Ontario
Vision Computers Eugene Oregon
Computer Direct Spruce Grove Alberta
Flickertel Minot North Dakota
Compuseller West St. Charles Illinois
Elden Computers Charleston West Virginia
Click Here Computers Ottawa Ontario
CompuWare St. Andrews Manitoba
Run PC Fort Collings Colorado

New:
The Computer Network
Falcon Systems

International:

Multimedia Studio Singapore Singapore
ETH Computers & Sten Ltd Vantaa Finland
COMPO EK Vaals Netherlands
OverScan/COMPO Berlin Germany
System Solutions London UK

/// Where can I get a CyReL CaTTamaran ? [3]
==========

The CyReL CaTTamaran is shipping to a lot of dealers all over North America right now. Please check with your nearest dealer for availability. In case you are not able to get your CyReL CaTTamaran Accelerator through your Atari dealer, please contact Cybercube directly at the addresses provided below.

/// How much do I have to add for Shipping and Handling ? [3]
==========

Please add $6.00 for S&H (regular mail). We also offer shipments via courier. For more details, please contact Cybercube directly.

/// Can I return the product if it will not work in my TT?
==========

Yes you can. We will offer a 10 days return policy. Please check for details when ordering. Note that there is a handling fee involved when returning the product. When you return the unit, we will refund the cost of the unit minus 15%. [3]

/// Will any de-installation require soldering ? [3]
==========

Yes. In case the CyReL CaTTamaran might not work in your TT030, and you decide to return it, you would have to solder the one connection that had to be cut during the installation of the unit. This is probably the best and most durable way to do it, but other means of reconnecting that one connection can be devised in case you do not have access to a soldering iron.

/// Is there be a special GEnie topic for the CyReL CaTTamaran?[3]
==========

Yes. Please go to the Atari Roundtable (m475;1), enter the hardware category (set 4),then read all the latest news in the CaTTamaran topic (rea 33 new). We would be happy to see you there and provide any further assistance.

/// Where can I get more information if I have additional questions?
==========

Contact either your nearest dealer, distributor or Cybercube directly. We will be glad to be of assistance. To reach us, send e-mail to:

GEnie: CYBERCUBE
CRS-Online: Cybercube Research
InterNet: cybercube.research@canrem.com or
cybercube@genie.geis.com

If you want to write us, please send your correspondence to this address:

Cybercube Research Ltd.
126 Grenadier Crescent
Thornhill, Ontario
L4J 7V7, Canada

Or, if you would like to call or fax, you can reach us at:

Telephone: (905) 882 0294, Mon-Fri, 10 AM to 4 PM EST (Toronto)
Fax: (905) 886 3261

I have the following to get rid of...
Atari 520Ste 4 MB Ram.
Atari SM124 monochrome monitor.
270MB hard drive.

The Ste needs a new power supply the rest are in good working condition.
Make me an offer, otherwise they go to the binman.

> Depot, &c..?

Well, you do need software for the Atari for the scanners. <G> GT Look supports Epson Scanners, but I don't know if it is still being actively developed. I purchased an Epson ES 800 (US model number, European model number was different) years ago and GT Look did fine.

Search on Homa Systems House. They have drivers for different scanners. I know they support HP scanners, and I _think_ Microtek, and a couple of others, I believe.

I can find the URL if you can't.

>
> Was such a thing ever made?

At least one was, the CaTTamarran. Can't remember the company name, but they also made a graphics card for the TT. Accelerated the TT to around 48 mhz. Worked better on some than others. It couldn't accelerate the FPU in mine, and when I put in an 8 meg ST Ram daughterboard, it would crash the computer. I chose RAM over speed, and sold the accelerator to my dealer.

Ah, yes, a book. I hate to start something else <G>, but finding the right book is almost like searching for hen's teeth. That was one nice thing about the original Atari manuals, they were written for the beginner. It's damned hard to find any computer book these days written for the beginner. I've spent too much money trying to get some answers for Visual Basic for Applications (part of the Microsoft Office packages) and haven't been very successful yet, but a possibility has finally arrived. A major part of the problem is, although there are books in print, they are not in the bookstores. :-(So you can't look at them before you buy.

Hi Andy! That's the way I use it, since there does not appear to be any specific s/w that will run on a TT/Hades for amateur radio. There was one for the ST which was great (Amterm).

>or does FDT include any special support for Packet?
No, none. But you can config the F keys to issue different commands.
BTW, FDT seems not to like MagiC at all. It's fine under TOS.

Cheers,
Charles, gm1mcn.

Depends on what make his TNC (Terminal Node Controller is, I think. Mine is
AEA Pakratt 232 which can decode weather images, tho' I haven't done it for
some years.
You might try posting the question in an amateur radio NG,
eg: uk.radio.amateur
or: rec.radio.amateur.misc
Or try ARRL (American Radio Relay League) at http://www.mvangel.com and email them;
or http://www.rsgb.org (Radio Society of Great Britain)
or http://www.ukrs.org.uk (UK Radio Society).
There is a similar Amateur Radio organisation in New Zealand.

>He already has the relevant radio and modem equipment and uses this with
>his ST for packet radio. However he does not have any software for
>decoding the weather satellite images.

AEA (Advanced Electronics Applications, Inc) produced software, but I believe
they have left the field (?).

A search for that name, or for TAPR (Toronto Amateur ...., I think) who also
designed stuff, might produce results.

Sorry I can't be more definite or specific: memory's not what it was :(

Cheers,
Charles.

Hi,

Anybody who has a Nemesis program called NEM_PRINT ??
It should patch the Atari F030 printer port.
I need it to use my SoundPool MO4 midi expander.

6572. Re: Sharpscore notation program

Newsgroup: comp.sys.atari.st
Date: 2000-06-01 00:00:00 UTC
From: Frank Zimmerman <zimmerman@uniserve.com>
Message-ID: <959886328.567675@neptune.uniserve.ca>
Source record: 61375

Fellow Music Notationers,

I've been using SharpScore 3.2 since May 1994, and simply love it. I've tried demo's of just about every PC scoring program I could find, and while many of them do things SharpScore doesn't do, there are certain things that SharpScore does which they do not do! (for example, having different length staves on the same page) All in all, I find it the easiest scoring program to use on any platform...still.

When I first discovered SharpScore, via an ad in one of the glossy UK Atari mags, I called the company, and asked them a number of questions. I had been using Notator SL, and was frustrated by it's limitations. All of the answers I got from the company were positive (sounded too good to be true), so I ordered it. But everything they said about it was true! I dropped Notator and haven't looked back.

I've been producing a songbook of folk-based Christian music, mostly drawn from early American (late 1700's to early 1800's) and renaissance sources. It's partly done and some sample pages can be viewed at: http://users.uniserve.ca/~zimmerman/Music.htm. The music was laid out in SharpScore, then output as 300dpi IMG. I then touch these up in Dr. Bob's MVG (simply the best and fastest program for editing IMG music files), moving Chord letters and hyphens so that the score is perfect. Then I put these into Calamus SL99, and add borders, pictures, page numbers, and appropriate Bible texts.

I once called up Take Control and interviewed one of the fellows. I was intending to write an article about SharpScore for an Atari magazine, but never finished it. Anyway, I talked to him for about 45 minutes, and during the course of the conversation he mentioned that they had put out a minor update to SharpScore 3.2, which fixed a few bugs with NVDI. He said that they would send me the update but I never received it. About a year later, I wrote them and sent them 10 pounds to cover the cost of sending me the update but I heard nothing back and never got my 10 pounds back either (I guess they had some free beer at my expense). He also mentioned that they were working on a PC version, but I guess this never got completed either. That's too bad. It would be neat if we could get them to release it as freeware. It would be even better if we could get the source code! Then maybe we could remove the 300dpi limit...

I've tried SharpScore with GDOS, SpeedoGDOS, and NVDI. I use it now mainly with NVDI since that is a system enhancement I always like to keep running. There is one minor glitch with NVDI where the "Show Markers (F7)" feature doesn't work. Instead of a small box being drawn to show where to grab the music symbol, you get a small dot, which is almost invisible.

I've also found that some vector fonts cause SharpScore to bomb when loading, or take the place of the bitmap music font, so I usually point NVDI to a blank folder for fonts before running SharpScore. I use the standard GDOS bitmap Dutch and Swiss fonts that came with SharpScore, and their output is very good. In fact, I have found that at 300dpi, the bitmap Dutch fonts look better than vector fonts.

I find the MIDI implementation to be a bit weak, but I don't use this feature much anyway. If you fellows have any questions, or have some interesting music templates or tips, I'd like to hear them.

Regards,
Frank Zimmerman
Creston, B.C., Canada.

>What flat-bed scanners can be plugged into an Atari these days?
Homa Systems SCANX was designed for the E3 and E6 Microtek and
the Umax 1200 series, but neither of those are still being
made. Try looking at http://www.magma.ca/~nima/ . Upon checkin
Umax's site, I noticed that the Macintosh software for the 1220S
and the 2400S is identical. Homa's site says that the latest
version SHOULD run the Microtek X6. If true, this uses the same
software as the X6 EL DP and the V6USL. So, from Nima at least,
I promise the 1220S will work (still available...barely) and the
2400S, X6 El DP, and V6USL will probably work (though I can't
guarantee it). You might also look on Ebay for an E3, E3+, or
E6. Prices range from $20 - $50.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

I dont know about where you live but the heat wave has hit here
already. In an effort to stay indoors, I got another bug worked out of my
CAB.OVL.

It now parses the subject off of mailto posts. So you can now use
it properly with ATOS.

http://www.netset.com/~baldrick/

If you get 2 alerts on these posts dont worry as long as one of
them is a success message. I dont understand why the second one is
occuring. I am sure I will track it down in time. However ignoring that
it seems to work fine.

I have a very early release of magicMac (1.05) and a similar vintage of
NVDI. I recently got a price from System Solutions for an upgrade, but
it seemed a bit expensive to me. Also they want me to mail back my
original master disk which makes things a bit cumbersome from this side
of the world.

What improvements / advances would updating offer me ?

Hahaaa! I was thinking of the days before Unix was invented.
The command history was on the scroll (the paper one). Only humans could read them back.

> I recall reading that the slow
> speed of ttys may have contributed to the 'terse' nature of many unix shell
> commands.

Think! The best typists reach 10 ch's a second. The more common only 2.
In stead of learning to type fast, they kept the amount to type low.
Very sensible, and a relieve for reader of course.

Yeah. But it really started with high level languages and sophisticated editors.

> Seriously though, I think there is definitely a place
> for command-line interfaces. They're ideal for scripting, and require *much*
> less in the way of system resources than graphical user interfaces.

That is true. Unfortunately these script languages are so weird and so many.

> Also, I
> can't help wondering if the conversational nature of CLIs make them more

> appropriate for text to speech setups than other interfaces.

True as well. In starships there is room enough for embedded processors of such capacity.

Did you notice that Star Trek people talk to a 'computer'. It would have been far more illustrative when they had talked to the 'ship'.

"Ship! on screen!"

Yes I know of this feature, and I did turn it off, but Iconnect
apperantly don't work with APPLE Remote Access. It works without any
problem with the "old" MacOS 8.1 but not with MacOS 8.6

6590. Dumb question re: scanners

Newsgroup: comp.sys.atari.st
Date: 2000-06-01 00:00:00 UTC
From: ag352@chebucto.ns.ca
Message-ID: <8h4tv0lfu2@News.Dal.Ca>
Source record: 61444

hey, I'm supposed to know this stuff. I used to publish an Atari fanzine
(hiding face in shame...)

What flat-bed scanners can be plugged into an Atari these days? I remember
there was some interfacing software back in 1998, but does it meet the
current crop of ubiquitous $139 (0r whatever) scanners as sold at Office
Depot, &c..?

JG
very much out of touch
with profuse apologies to the former loyal readers of XEST

6591. Another dumb query: TT accellerators?

> yes it does.

Note that the LINK96/97 has its own SCSI ID 7. So you can only connect
up to 7 devices with ID 0-6.
With SCSI it's correct that the computer also gets a SCSI ID and that's
why the LINK96/97 is capable of connecting devices to the ACSI bus that
won't work with any other Link adapter, namely those devices that expect
the computer to have a SCSI ID ("Initiator Identification").

Maybe you didn't activate the corresponding device IDs in HDDRIVER.

Charles Stanley wrote:

> Please remove my ignorance: what is a FAT32? What for? Why should anyone
> want one? Etc.

Because he might want to exchange data between Windows and TOS using
partitons that are larger than 2 GByte. Or because he created a FAT32
partition under Windows and now wants to access this partition under
TOS. Or because he uses MagiC and requires partitions larger than 2
GByte just for the Atari.

GTLook isn't being developed, in fact it was released into the PD late last
year IIRC. I have an English version on my web site, follow the Apps link.

I have no idea of its capabilities or what scanners it supports, however I'm
given to understand that it will drive scanners attached to the parallel
port, allegedly there was some sort of adaptor which also attached to the
Midi port (presumably to provide control signals or power).

All in all I'd endorse your recommendation for one of Nima Montaser's
drivers, I use one with a Microtek E3 SCSI scanner.

You don't need any logon script (ie you don't need anything in the section
headed "Dial Script". Don't delete that line, STinG still wants to see it,
even if it's empty.

With a PPP connection the dialer should negotiate everything needed itself.

If you don't run VFAT then any drives with LFN's have their contents
displayed with a truncated version in the 8+3 format.

Fat32 is to allow disk sharing with Windows drives that have a fat32 scheme
AIUI.

AFAIK you only _format_ a hard drive if you have bad sectors. During the
format stage, the bad sector list is saved to a table in the drive's
firmware. Otherwise _partioning_ is good enough (and much quicker).

>Will HDDRIVER work with ICD's partitioning?

Only if you don't choose ICD's special partioning scheme IFAICR.

>The other advantage of formatting is that it obliterates any old and
>possibly confidential data on the drive - or is it inaccessible anyway

Either way destroys all data on the disk.

When I had a Nemesis I found the answer was to use a printer spooler, I used
GEMSpooler but I'm sure that there are others (GEMSpooler is/was shareware,
I'm not sure if there is any way to register it now).

The Nemesis patch didn't work for me.

But when simply partitioning somebody with the right tools and
sufficient knowledge will be able to restore the old data at least
partially.
Usually it's not important whether any old data are left and could be
restored up to a certain degree. But if you want to ensure that nobody
can ever get access to old data you have to explicitly overwerite them
with the appropriate tools or format the drive. But in the latter case
note that, as already mentioned in one of my previous postings, not all
drives might actually overwrite the data. A drive that only takes a few
seconds to format itself definitely won't.

Newsgroup: comp.sys.atari.st
Date: 2000-06-02 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <8h8cbpjsh1@nnrp1.deja.com>
Source record: 61260

Hi all,

I just got some free time to spend on the library, and I added this:

Updated archives:

5 : trashcans +8 icons
27 : hardware +10 icons
30 : animals +28 icons
51 : folders +15 icons

New archives:

52 ; Cool Blue (72 system icons)
53 ; Sketch (35 icons)
54 ; BeOS (73 icons & 13 mini-icons)
55 ; Mac-style (113 icons)
56 ; Macintosh icons (76 icons 52 mini-icons)
57 ; Smileys (17 icons)
58 ; Mixed set (127 icons)

New artist archives: (All icons by Hide Itoh)

6; Tea icons (18 icons)
7; Vegetable icons (30 icons)
8; Tool icons (23 icons)
9; Halloween icons (28 icons)
10; Webcam icons (15 icons)

Many icons converted by Dieter Junius,
and some by me :)

Don&#65533;t forget to send any feedback, suggestions or wishlist for new
icons!

/Joakim

2.1.5 (the last version I had) was noticably quicker and more stable.
From memory (all my manuals have gone now I've sold it) it also
introduced long filenames and better memory management. There were more
improvements but it was a while ago and I've forgotten what they were.

It's not an upgrade I regretted though! The latest version is not 2.1.5
though! So that may be better still.

Source record: 61262

Hallo Charles!

CS>what is a FAT32?

It's a modification of the known FAT(16) filesystem, using 32 instead of 16
bits for the FAT entries and thus allowing for the use of rather large
Partitions with fairly small cluster sizes.

CS>What for? Why should anyone want one?

If you had, for instance, a 1 Gig partition with FAT16, each cluster would be
32k large, and each file would use at least 32k on the disk, even if it had
just a few bytes of data in it.
This applys if you have a huge number of relatively small files, say the
www-cache or Newsie's mail-folders. In that case, way more than half of the
partition's nominal capacity would be unusable.
With FAT32, the cluster size can be as small as 1kB, thus allowing for less
waste of disk space.
On the other hand, the smaller the clusters are, the bigger becomes the FAT
table itself. Therefore, using 4k or 8k clusters would make for a good
compromise.
FAT32 is available for both MagiC 6 and MiNT. No option for TOS, though.

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

Hi Ken,

I have not got the final release versions yet, but I have got copies of
both TOS and WIN pre-release beta versions and there seems to be no
problem at all doing this. In fact, it is the reason I am so pleased
that this software is now available, as it is much easier for me to have
the same programme on both platforms.

I'll see if Ulli can confirm what I have said and let you know.

Cheers

Paul

Hello Henk!

HR> Hahaaa! I was thinking of the days before Unix was
> invented. The command history was on the scroll (the
> paper one). Only humans could rea them back.

Some command history mechanisms would work on paper.
I'm thinking of a shell I used years back where each command line was numbered,
and you could just tell it to repeat a previous command (I seem to remember
that some editing was also possible).

[Bloatware]

HR> Yeah. But it really started with high level languages
> and sophisticated editors.

Not to mention graphical user interfaces! <grin>

HR> Unfortunately these script languages are so weird and
> so many.

Not always, CP/M and DOS for instance had pretty straight
-forward scripts as I recall.

HR> Also, I can't help wondering if the conversational
> nature of CLIs make them more appropriate for text to
> speech setups than other interfaces.

HR> True as well. In starships there is room enough for
> embedded processors of s capacity.

I get the impression you're over-estimating the
requirements, we used to use this back on 6502 based machines with little
phoneme chips or routines. It's been a standard capability for years on Amiga
and Mac platforms. Some people with sight problems use computers this way
every day, and now it's being used more and more to access computer based
services via telephone.

HR> Did you notice that Star Trek people talk to a
> 'computer'. It would have been far more illustrative
> when they had talked to the 'ship'.

Well, not being a sad trekkie type I couldn't point out
the Voyager episode where a ship with some sort of neural interface gets the
hots for Tom Paris... (oops, I guess my secret is out! ;o)

Groeten,
- Andy.

Ok, may I put my question again?

I am running Magic 6.1, HDDriver 7.80. I have VFAT long filenames
turned on on all my non-floppy drives. I have used HDDRUTIL and
makefatfs to create a FAT32 partition on a cartridge in a Syquest
ezFlyer drive. Magic refuses to recognize the ezFlyer with that
cartridge in it, even if I boot from cold with the cartridge in the
drive.

What else do I need to do to get Magic to accept a FAT32 partition?

Define "freezes". A quote from the manual (did you read it yet?)

A common mistake when using ROM image files is to incorrectly
name or place the
files. ROM image files go in the root of your PC's C:\ drive.
192K or ST-only
releases of TOS such as TOS 1.0, TOS 1.4, TOS 1.4 developer's
release, KaosTOS,
etc. are to be called TOS.IMG. 256K or STE compatible releases
such as Magic PC,
TOS 1.6, TOS 2.06, etc. are to be called MAGIC_PC.OS. Disk
releases of Magic
are simply called MAGIC.RAM as they are on the real ST.

Make this change (if you haven't already) and then tell me what
happens.

You don't need to buy. Try using a library (I'm a librarian: I know what
I'm talking about!).

Even an out of date introduction to the net will tell you about Usenet
etiquette.

WRT your other problems with book choice, you could also try asking at
your local library: they may be able to advise. They do that sort of
thing all the time :-) If they can't advise, they may be able to point
you in the direction of someone who can, or at least to some books which
you can check out yourself to see if they are at the right level.

Don't know the situation in the US (where I presume you are based from
some of the stuff you've said), but here in the UK you can also borrow
just about any book published in the UK via inter-library loan (through
your local public library) either for free or for a small charge. Try
asking your local library again - they may have similar national or
regional arrangements in place. So if you can get together a list of
likely candidates (maybe search the online bookshops such as Amazon and
bol.com for ideas, or even library catalogues available online - the

latter may have less descriptive info, though), you could request them via ILL and evaluate them that way.

For the benefit of those in the UK: your local library may set limits as to how many requests you can make as the service is heavily subsidised - it costs them about 6 UKP per item, you usually pay 1 UKP or less (sometimes it's just the cost of mailing you the notification that it's arrived). Policies will vary between local authorities as to pricing and quotas. NB I work in the academic sector so I'm not necessarily up to date with public library practices, but I have no reason to think they will be wildly different to what they were a couple of years ago when I last checked.

True, but I stand by my remark. If they are so computer-illiterate that they aren't capable of opening up a text or HTML file they are probably incapable of understanding the solution to their problem, ie beyond help in this context.

Hi Peter

>You are of course correct on both counts, BUT formatting has the
>advantage of performing a bad sectors check first, which your HDDRIVER
>doesn't do (which is why it so usefully fast!).

I think bad sectors are very nearly a thing of the past, some SCSI controlers do this trasparently, but if you have a drive that show bad sectors its probably time to bin it.

>ICD's partitioning does a bad sectors check,

You can select this in HDDRIVER as a non-destructive test.

>which is why partitioning with it takes so long.

>The other advantage of formatting is that it obliterates any old and possibly
>confidential data on the drive - or is it inaccessible anyway once an HD has been
>repartitioned?

Not all drives are zero'd with a format operation, and re-partitioning also doesnt zero the data tracks, it just creates a file system on the drive, so the only way to do that is a destructive sector test.

> solder

...and he's not kidding! ;^)

I have succesfully made a Din13 to DB15 VGA style adaptor (for the exact reason
of using an NEC 2d/3d multisync). It worked fine, so I considered going into
'production', but the 3 weeks with the solder-sucker required to produce
each one meant my price was too high to really consider it as a valid
business opportunity! :) Shame cos it even had a TPST switch to go from
mono to colour modes...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Try to recognise it using GEM-view 3.1x, and if you have no luck you may
need to find a PC/Mac program that can recognise and convert the image.

GraphicConvertor on the Mac can output GEM IMG's, GIF's and many other
formats that are common on Atari...

Most dialog boxes/alerts etc come from the RSC supplied with the GUI. If you use MAGXDESK, then a german version of MAGXDESK.RSC can be anglicised by simply editing the RSC file with a good editor like RSM. Some dialog boxes etc are inbuilt into MagiC (why escapes me!) but most should be able to be translated...I'm sure Jinnee/Thing/etc also use an RSC for the alerts etc...

HDDRIVER also can do a bad sector test. There a menu option for this.
But since modern drives do all the defect management on their own such a
test nowadays doesn't make this much sense as it did with old non-SCSI
drives.

> a bad sectors check, which is why partitioning with it takes so long.
> Will HDDRIVER work with ICD's partitioning?

As long as the partition layout is Atari compatible there won't be a
problem. Unfortuntaly the old ICD format was not compatible to the
format documented by Atari. In this case converting the format with
ICD2AHDI by Thomas Binder will help. Note that you won't lose any data
when doing this.

> The other advantage of formatting is that it obliterates any old and
> possibly confidential data on the drive - or is it inaccessible anyway
> once an HD has bee repartitioned?

Some of these data can be recovered with tools like DISKUS and a lot of
time. Note that some drives don't erase data during formatting. This is
at least the case for some Quantum drives which only take some seconds
to format the drive.

System Solutions sells HDDRIVER with an English manual. I don't know the details in your case but in general you shouldn't buy the German version when you don't speak German.

6636. STOS and GEMulator?

Newsgroup: comp.sys.atari.st
Date: 2000-06-03 00:00:00 UTC
From: Gregory George <greggeorge@worldnet.att.net>
Message-ID: <39386C1D.2E0A8054@worldnet.att.net>
Source record: 61282
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi all,

For some odd reason, I decided to fire up my ST and finish writing a game I wrote starting in '96. Well, my old ST isn't what it used to be, so I need to finish the game on GEMulator. Problem is: My ST's floppy drive (actually the sound chip/floppy controller) is whacked and I can't copy STOS from the hard drive to my PC. I have the original disks, but two of them (games and accessories) will not read in my floppy drive.

Anyway, does anyone know where I can get a copy of these two disks on the internet?

Also, has anyone else tried STOS using GEMulator98? My mouse doesn't want to work, which makes it a real bear to load a file into it.

Thanks,

--
Greg

Hi!

You should be able to find it somewhere, I believe STOS is now freeware, at
least the sourcecode for STOS itself is..

Hi!

How about it? How about porting STonX to the atari? Then we could run all
those nice apps that refuse to run without TOS 1.x & old hardware.
Anybody else into this?

Cheers!

/Peter

They also ported a Mac plus emulator called vMac to the Mac so the newer macs could run old software.

No reason why it can't be done, more like if someone can be bothered doing it.

Howdy Paul,

are the betas you refer to the download demo versions of Papyrus? I was wondering a couple of things: can Tos Papyrus run on a Mega ST4 from floppies, or must it be installed onto a hard drive? And, what are the limitations of the demo version? (ie, crippled saving abilities etc). Thanks for any info you or others may have,

Matthew.

A librarian! Cool! <G>

That's a good idea, but I've found most libraries to be short of resources in the computer reference area such as we are talking. I've not had a chance to check the local university library, but I will be going there for other reasons very tangentially related to computers for other things, and will try to remember to check.

There are interlibrary loan programs in existence, but I'm sure it's not universal. And not all libraries have access to the info you are looking for. Often, libraries are simply not available. And if you can sign up with a remote library to have books sent to you, often you have no idea what's available and the librarian may not be able to help when you start to get too specific. And, of course, they can't send every book at once to you, they have to keep some in the library for the folks who walk in the door.

Mailing these books to you can get expensive, depending on weight and distance.

> in this context.

If we are talking about the lady and the DOS class I wrote about earlier, you're right until computers have evolved to the point where you can simply talk to them. Otherwise, the user may simply be ignorant in how to open the file, and some teaching here could help.

One thing I've noticed over the years, in life in general, is that the longer a person is involved in ????, and the more he/she knows about ????, the more intolerant many become when they encounter other people who are not as literate in ????.

::thinking:: Maybe that's what I've been reading as an undercurrent in some of these FAQ posts that started this thread, a tone of intolerance from a view. Maybe that's what bothers me about them.

Maybe we should start a new newsgroup:
comp.sys.atari.st.psychiatrist! LOL!!!!

Hi Simon

I sent an email to above and got a message back how to sign in.
Problem is I can't reply the email cos the email address is too long
and doesn't fit.
And using the text only web browser in Newsie doesn't allow you to
enter in forms.
CAB 1.5 doesn't like the half of egroups pages saying /table is
missing. (does that on a lot of sites though)
I managed to get to the sign in page with CAB. So I put in my email
address and password that I got from the Email and it said Document
Moved.

Intolerant, yes, but that is the old culture of the net. RTFM first, then ask.
There seems to be acultural gap between the newbies and people who know the
rules of the game, but if you ask me, I think the old ones are right and that
the newbies should hang their heads in shame.

The demo of version 8 for TOS is over 2meg, so I would assume that it
must be on a hard drive. I would assume the demo cannot save docs
and/or possibly print.

Shoot I would love it. Then I could play some games on my Hades like
Dungeon Master and Knightmare. When I try to run some old ST programs,
I get the sound (Hades has the same soundchip as a regular ST), but no
picture.

You don't need to run VFAT to have drives with LFNs displayed as LFNs.
All it needs are the following lines in MAGX.INF:

#[vfat]
drives=[drive letters of VFAT partitions/floppies]

e.g. using

#[vfat]
drives=abdefghijklmnopqrstuvwxyz

as I do, enables VFAT for all partitions/floppies except C:

The demo actually saves just fine. It just can't print more than one
page documents, ,switches some letters while printing (i.e. d becomes
b, e becomes c, etc.), and the database can't take more than 100
entries. Other than that, it seems to be fully functional.

>desktop.inf?

Whoh!, dont panic. Its probably just a case of going to the menu bar and selecting the relevant install icon, specify C and then use save desktop to create a desktop.inf.

If this doesnt fix it then your problem is not desktop.inf related, you may find you have to re-install your hard disk driver software.

>are the betas you refer to the download demo versions of Papyrus?

Probably not. They are versions supplied for beta testers and had no
restrictions.

>I was
>wondering a couple of things: can Tos Papyrus run on a Mega ST4 from
>floppies, or must it be installed onto a hard drive?

I don't know about running it from floppies, but if you want to have a
good selection of fonts available a hard disk is very useful. (It is so
long since I ran things from floppies I really don't kow what you can and
can't do !)

I am told it will run from 2 meg of ram, but 4 meg is recommended,
especially if you use NVDI and/or a multi-tasking set-up. Papyrus runs
well for me under single TOS, Mint/N.AES and Magic, but you only get the
colour icons in Magic :-(

>And, what are the
>limitations of the demo version? (ie, crippled saving abilities etc). Thanks

Hello,
Received a flyer today with news about the Atari/Amiga expo in Neuss. I quote :
The new Milan II will definitely be presented on a 60m2 stand.
The national and international press will be present as well as the TV (there will be a 8 minute WDR broadcasting about the Milan on June 10th.
Besides the presentation of the Milan II, there will be many new Milan II goodies : new comfortable System-Manager, Resolution-Switcher with integrated Themes-Manager, new glow-Icons and more.
If the system sells well, computers with integrated TFT display, Milan based Web-Pads, Tos compatible Pocket organisers will follow.
Presentation of design-studies for the next generation Milans (PPC ?)
Presentation of the new Milan HDrecording software "Take".
Bubbles will be the new official Milan screensaver.
New version of CD recorder 3
Introduction of the "Papyrus killer" : Tempus Word 4.0 (scanning integrated)
etc.......etc......etc........
Also sensational Amiga presentations !

See you in Neuss
Dan

Hi all!

I have been working on a little hardware project that allows you to
connect your 520ST (and similar computers) to a JAMMA arcade cabinet.
It is finally to a stage where I can post some information about it.
The prototype is complete and working.

If interested, checkout the following:

http://www.hackedp.com/atari/st2jamma.html

I have some instructions on how to build the board and some pictures of
the prototype.
I hope to upload some pictures of the arcade cabinet/520ST in action.

I have to tell you that playing Gauntet II or Live and Let Die on a 25"
monitor rocks!

Later for now,

->Chris Martin

From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200006032004.a63538@wun.maus.de>
Source record: 61306

Hallo David!

DL>What else do I need to do to get Magic to accept a FAT32 partition?

Nothing else, normally. Set the partition type to "F32" rather than "GEM" or "BGM", and perhaps also set the "XHDI-Partition type" to "F32" (one of them), in the second menu entry of the "settings" (Einstellungen) section of HDDRUTIL.

That's all I've done here, and everything works perfectly on both my CT2A Falcon and my Milan 040.

Make sure that HDDRIVER sees the corresponding drive during bootup, and that Version 7.5 or above is actualy installed. Disable the boot image, so that you can see if the drive is still seen when HDDRIVER starts the second time (after MagiC).

For initialisation of the F32-partition on this falcon I used makefatfs -F32 -nFAT32 -s4 L:

If I had an empty ZIP disk, I would try it on that one myself...

This does exactly what using VFAT_CNF does, so you may as well use the GEM'd program to achieve it, mucho easier.

Thanks to everyone who replied, I will pass on all of this information. Just to clarify, I am advised that the image format in question is not the same as the group 3 FAX format used by Fax machines, so programs that would view these files are not useful. In any case, the problem here is not only viewing the image or converting it to a useful format, but also the lack of software to retreive the data from the modem and store it on disc. I am not familiar with the data format but perhaps a simple terminal program could be used. Anyway, I'm sure that with all the information that I have received we will be able to work something out.

Thanks again.

6666. [PUB] accelerator CT060

Newsgroup: comp.sys.atari.st
Date: 2000-06-04 00:00:00 UTC
From: Christophe Lucas <falcon40@club-internet.fr>
Message-ID: <8hc7ik$o6b$4@front1.grolier.fr>
Source record: 61311

You have more than enough to compile at the speed of a snail.
You want to surf quickly on Web.
You want calculate pictures under POV, make DTP or Graphics in a highly speed.
You want to run suitably applications as one to encode MP3 or a console Java under Mint.
You want keep almost totality of your software library (Demos and games with all reserve).
Etc...

You do not want you separate from all which makes the charm of your Falcon, his sound system, DSP, Videl (with his chunky and the planar), Blitter and all the connectique (SCSI, MIDI, 4 Joystick connectors etc.).
You want to put easily of Ram in great quantity for small price as offer at present standard SDRAM.
You want for example to put a card network, or a second DSP (Deesse card) by way of PCI.

Then it is simple, if you are 50 buyers, this accelerator will be produced.
Do not be shy and informed of your propositions, of your suggestions and especially say that you are interested.

For it send your messages to rczuba@free.fr

We inform you also the soon opening of a home page where you will have more further details on the promotion of this card and other product as the DSP Deesse card.

You have not an accelerator or you search for an new fast accelerator, seize the opportunity!
To send at the retirement your old accelerator but not your Falcon!

Thank you of your attention!

NB: Some characteristics can change (example: EDO or SDRAM and PCI or not PCI), the choice will be made according to your propositions!

You're right. I hadn't read it carefully.

> The file you require is available at http://lgd.fatal-design.com/.
> Do note that it will have to be renamed to MAGIC_PC.OS.

It doesn't work with Gemulator 2000. Mayeb they want
me to buy their ROM card :-)) The ROM file search button
fails to find the carefully renamed files that I put in the search
directory. I'll try a few other options, or maybe download
a different emulator. I'm getting my ST/e back today, so
maybe I'll just set it up somewhere...

I have a Falcon but I'd never subject it to such miss-treatment.
If and that is a big "if" all 50 buyers are 100% happy I *might*
consider it. After seeing all the ct2 problems discussed here
and on IRC there's no way I'd buy such a thing site unseen.

Dear Atari friends!

The Swedish Atari Users Association is proud to announce we are again
hosting this years show in Gothenburg.

The Nordic Atari Show in its sixth year and is the only all Atari show
produced in Scandinavia. The show has proved very popular for Atari
enthusiasts in Northern Europe.

Space is available for inviduals, companies, clubs and organizations
producing Atari related products and services.

If you know of any vendors, suppliers, anything Atari related that you think
belongs at this show, let us know.

Help us to get the word out about this show.

The show will be held the weekend after the "World of Alternatives"
show in Germany.

In den letzten 6 Jahren ist die Nordic Atari Show zu einem festen Event
in der TOS-Szene herangereift, der mit jedem Mal besser besucht wird.
Austragungsort sind die Rï¿½umlichkeiten des Sinpro Gï¿½teborg
in Schweden. Veranstalter ist die Swedish Atari User Association.
Gesucht werden weiterhin Atari-User, die Vortrï¿½ge zu bestimmten Themen
halten mï¿½chten.

>> FERRIES
There is ferries to Sweden from Finland, Poland, Germany, Denmark
and England.
By car it is easiest to get to Sweden from Helingï¿½r/Helsingborg
Denmark/Sweden or the Stena Line ferries Kiel/Gothenburg and
Fredrikshavn/Gothenburg. The ï¿½resundsbron-bridge opens up in july.

Here is contact info from Stena Line HQ in Germany and Denmark (Fredrikshavn).
There is no need to pre-order car tickets at Helisgï¿½r/Helsingborg.

6673. MPlayer (and others) now freeware!

Newsgroup: comp.sys.atari.st
Date: 2000-06-04 00:00:00 UTC
From: ddc@imaginet.fr
Message-ID: <8hdd30$rs6$1@reader1.imaginet.fr>
Source record: 61318

I send this message on behalf of Guillaume Tello.

Since he is no longer programming on his Atari, he has decided to
release all his software as freeware, including source code.

All the archives can be found at http://perso.wanadoo.fr/gtello

Now a personal word:
While it is always a little sad when one of our programmers abandon the
platform, I would like to personally thank Guillaume for the decision he
took. Releasing his work as freeware, sources included, is a great
farewell, rather than burrying his work.

Thanks for your attention,

--

Hi folks,

Had a lot of icons that needed to be uploaded so I sat down today and
updated the icon library yet again.

For those who cannot read signature files, here is the URL: ;)))

Atari Icon Library: http://gokmase.atari.org

This is what is new today (2000-06-04)

New archives:
----
59 BeOS/BeOS-98 (72+22 icons)
60 Mac8.5 set (101 icons)
61 Hitech set (44 icons)
62 Next-98 set (39 icons)
63 Documents (35 icons)
64 Macish system set (73 icons)
65 Macintosh icons (130 icons)
66 Set with icons in 3d (86 icons)
67 iMac icons (35 icons)
68 More 3d macish icons (55 icons)
69 Application icons (24 icons)
70 Mac network icons (14 icons)

All icons converted by Dieter Junius this time

Enjoy the new icons, and please send any feedback, suggestions, icons or
anything to support this icon source!

/Joakim

Sure "problems" often makes more discussions as real working units.

Iï¿½m self and a lot others doasnï¿½t had any problem with the CT2.
Most touble, in my humble opinion, you hear about self fittet boards.

Only a smal group of people fit the CT2 well as self. Any other, and
that was the offer of CENTEK since the first CT2 boards, should use
the fitting service.

Other: Iï¿½m not sure an CT060 will be released ever.

Isnï¿½t the same story as with the "30" CT2 for TT Computers?
Anybody seeï¿½n an CT2 TT acellerator anytime? Iï¿½m not. Sorry.

I like the 060 idea, but it is realy expensiv as an expansion of
an "old" falcon..

Well that is sad news for one, and good news for another. I've always thought he was a decent guy!

I second that! And wondered why I hadn't heard from him for a while .... I was dealing with the Uk registration of MPlayer. Still, as you say, at least it's now avilable for anyone rather than being lost forever. It is still a cracking program.

If you haven't already got it I'd suggest you have a look!!!!!!!

Glow-icons is just a cosmetical thing. What we need is a up-to-date
browser. Without that the Milan II won't be a price seller. And please
don't say that the Milam II will come with a very good browser, called
Adamas. I never have seem such a crapy thing in my life. The worst of all
is that it's a commercial product.

Bubbles is a product of Run software and is AFAIK the only screensaver
that is still supported.
http://www.holger-herzog.de/run-software/start.htm
It's surely not the cuttest saver but it works with N_AES and MagiC and
that's what counts nowadays.

I have to agree here. I hate to be negative, but if it is released with
any of the current browsers only a handful of people will buy it. Only
diehard atari freaks wanting some speed will buy it. Wasn't one of the
excuses for the last delay something to do with changes to appeal to
non-atari users? I don't think in todays inet hyped world that anyone
outside the Atari platform will seriously consider it. The typical pc
users I see go for the flashy stuff, and not icons, I am talking
quicktime, mp3, shockwave, flash whatever and if that stuff is not there
it surely won't sell very well at all.

Note I didn't single out any one browser. ;-))

It's very simple. It will only appeal to non-atari users if the
pre-installed software is as capable as that of a PC or MAC.

6683. Atari SCSI interface and PC

Newsgroup: comp.sys.atari.st
Date: 2000-06-04 00:00:00 UTC
From: nobody@nowhere.com
Message-ID: <393a874e.29485096@news.btinternet.com>
Source record: 61328

Hello,

I've recently acquired an old Atari SCSI interface that is designed to connect to an external SCSI device via a 50 pin connector, then connect back into the DMA port of the Atari.

I was wondering if it would be advisable to install this device inside my PC, connect it to my PC's SCSI card via the 50 pin slot internally, then run the DMA cable back to the Atari so that the Atari could pick up the SCSI chain.

The interface is dated 1987, and has power connectors which look like the same as found in todays PCs (although are coloured differently - yellow blue green white intead of yellow black black red). I was wondering if power and SCSI are of the same standard now as it was then, and could this configuration possibly work ?

Any help appreciated,

Mark.

|limitations of the demo version? (ie, crippled saving abilities etc). Thanks
|for any info you or others may have,

Too big for floppies I think. Functionally the demo seems to be
complete (read, alter and save) but only one page docs can be
printed and even then with random letter substitution ('c' for 'e'
etc), and the database is limited.

I only downloaded it yesterday but immediately had a use for it - I
was able to read a doc which had been sent to me in Word format and
was able to read it and save it in Papyrus format to be printed with
Papyrus 5.

It will take some getting used to.

Regarding Word compatibility, it is not 100% compatible in the demo. I have a Word 97 file I created that locks up the demo. It appears that to import a Word doc, it first converts the file to RTF format. I'm basing this conclusion on the title in the MS-DOS window that is opened when you select the file to import. In my case, it locks up after approximately 38% of the file is converted. I don't know what the current RTF standards are, but I'd bet that tables and form fields are not part of the standard. I have these in this document, and what I'm doing can be accomplished by Pap version 5. I had planned on making a Pap version of this file.

I'm still planning on purchasing the Office version 8 tho'.

> I know a few people who had the "fitting service" and are not
> completely happy. Call me *highly* skeptical I guess.

I donï¿½t know.

Different results maybee a good sign and a good platform to talk about
the CT2 ;)

MOST of the machines that anybody bring over here only had problems with
there own software and a lot of things in autofolder, acc, cpx that
nobody realy need in autofolter, cpx folder or as acc. Some of them try
to run software from an internal ide hard drive that not respond correct
in turbomode. Best example is the original conner IDE.

MagiC wonï¿½t run well in turbomode.

So you can found a lot of selfmade trouble sources.

I will not say that anything about CT2 is realy fine, but something is
selfmade an can be removed with simple tricks.

Thatï¿½s only what i see here if anybody grab the CT2 if it was new.

Sure, any computer is a good source for any kind of trouble.

Regards, Robert

True, but I assume that he doesn't have that in his MAGX.INF. I am not sure yours is the best idea, as it slows down copying with Kobold by quite a bit. I have only enabled bgh on mine, as that is where any LFNs are likely to be found - B: is only a safety in case I need to read a floppy with LFNs. I can always use VFATCONF to temporarily enable it on other drives if I need to (say for backup of G: and H: on a EZ135).

Gregory George wrote:

> Anyway, does anyone know where I can get a copy of these two disks on
> the internet?

Well, I managed to get STOS off of my ST. I was expecting more trouble out of the floppy than I actually got. I've also put it on my web space in case anyone else needs it. Compiler included.
http://home.att.net/~greggeorge/stos.zip

BTW, one of the extentions I've got in there (not sure which) would hose up GEMulator.

Has anyone seen a case where the ST works for the most part, but goes flaky just in some cases? In my STOS program, I am 100% sure certain screens were working perfectly when I originally wrote the program. And they work fine when I run the game on an emulator. But on the real ST, some screens are totally whacked. Any ideas why this would happen? Could it be a memory problem?

Thanks,

--
Greg

This is true. I've also seen enough CT2 installations to know
it is inherently repeatable. The simple fact it doesn't cause
audio disturbance is strong evidence of its stability.

>I�m self and a lot others doasn�t had any problem with the CT2.

>the fitting service.

Installing CT2 is a piece of cake compared to some less advanced
accelerators. My first one took two hours - I spent more time
dis/re-assembling the machine/de-soldering junk from the motherboard
and cutting some metal inside to make it all fit.

>Other: I�m not sure an CT060 will be released ever.
>
>Isn�t the same story as with the "30" CT2 for TT Computers?
>Anybody see�n an CT2 TT acellerator anytime? I�m not. Sorry.

A CT060 is closer to reality than a CT for TT. Most of the
technology for such a board has already been developed during
the Phenix project (060/PCI interfacing, custom SDRAM controller,
DSP and audio circuits), and used Falcons as hosts for testing,
so is proven to work. Routing a new circuit board layout would
probably take the most time; the logic design is mostly done.

The concept of a CT060 can almost be considered as a Phenix on
a daughtercard (without Dolmen, of course).

>I like the 060 idea, but it is realy expensiv as an expansion of

Sure would be, but theoretically the best value yet, compared to
all others.

Hello,
I just picked up GFA Basic 3.0 for the ST off of Ebay. Now, I'm somewhat proficient at Atari Basic for the 8-bit, and I guess I assumed that GFA Basic for the ST would be similar. This was wrong. I'd like to find some kind of tutorial, or howto, or book, or something like that to kind of teach me about this language. I've seen books about "Basic for ST" and other generic stuff like that. Namely "ST Basic Sourcebook And Tutorial". I don't think this is what I need, but I'm not sure. How similar is GFA Basic to the Atari Basic that this book is written for?

Have a look at my web pages, there is a GFA-Basic section
that should get you started.

The GFA Archives dowload section is probably still down.
I have no control over that, it's hosted by someone else.

URL is in my signature, as noted by others I guess I have
to point that out. ;-)))

True, but it saves starting the program, selecting the drives you want
to as VFAT and then exiting it afterwards. It doesn't really matter
which way it's done as the effect is the same.

If the generic comp.sys.atari newsgroup was widely available, it
would be an ideal newsgroup to post the URL to several Atari FAQ
available out there: 8-bit, ST, TT, Falcon, clones.

It is very hard to remove the CT2 once the 030 has been pulled out as it was in my case. The machine could not boot at all with out an absolute shitload of patches I considered this to be completely unacceptable. I havent heard of milan being in this boat, and considering the ct2 has a OS in rom (of sorts) I thought this could be sorted out.

Right, also the "manual"
They canï¿½t make the manual realy better. I canï¿½t found any word about a
lot of trouble sources. Thatï¿½s anytime a point of: " send email to
centekt and wait a week" ..

I think I'm one of the people you think of, since I posted quite a
few questions because of the problems I had after installation of
a CT2.
So I feel it necessary to say again that the troubles I had were
not caused by the CT2 but a bad soldering point and that I'm now
very satisfied with the CT2. Audio mastering, CD burning, rendering,
all these things work quick and reliable, SCSI is definitely more
reliable than before and since it's a 030 and has the switch for
slowing down to normal speed there are no compatibility problems
at all (the main reason why I would not change it for a ct60).

Gerhard

6707. [HELP] PC Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 2000-06-05 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <8hftli$mu8$1@nnrp1.deja.com>
Source record: 61203

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

I'm about 99% sure that this won't work. The SCSI chain is intended
to have a single master. The PC host adapter is one, and the Atari
host adapter is another. I don't think you'd fry anything by trying,
though.
But I might be wrong about that, and two masters will not work anyway.

> The interface is dated 1987, and has power connectors which look like
> the same as found in todays PCs (although are coloured differently -
> yellow blue green white intead of yellow black black red). I was
> wondering if power and SCSI are of the same standard now as it was
> then, and could this configuration possibly work ?

The power connector is intended for the the same plug that
is used on the drives. In other words, the same as in PCs. The
different colours make me a bit suspicious, though. But if the
socket is the right shape, I'd trust it.

6709. Uploading Freeware to Atari FTP sites

6712. Re: Papyrusdemo ready

Newsgroup: comp.sys.atari.st
Date: 2000-06-05 00:00:00 UTC
From: Terence Kelly <TerenceKelly@peoplepc.com>
Message-ID: <393bd176@flexnet239.uunt.net>
Source record: 61208

I had a chance to fiddle with the new english demo yesterday on my TT. There were some good things and many bad. (I use Papyrus 5.15 which I believe was the last English version released prior to this one.) On my machine running Magic 5 and NVDI 4.11 the demo has a few problems. First it doesn't recognize that Swiss 721 is available on my system, even though it lists it in the fontbox and lets me choose it from there. That means that the help files are displayed using the bitmap swiss font that comes with the demo and it is slow and hard to read. Rom also appears to have changed how Papyrus scales to the standard screen. In the demo, at 100% view, a 12 point font in Papyrus will be bigger on the screen than a 12 point font in any other gdos program at 100% view. This is really obnoxious if you're working at TT medium (which I have to since my TTM195 died). The standard view should accomodate an 8.5" paper with one inch margins and a vertical ruler at 640x480. Now it will not. None of the compatibility options fix this display problem. The slight overscaling also seems to put the font engine at a disadvantage and makes the standard display harder to read. It may also be responsible for the slight sluggishness I noticed in the scrolling compared to 5.15.

For Americans, ROM has still failed to include the standard American date form. (I wrote them about this years ago) They got close. You can now get "June 5th 2000" but not "June 5, 2000" as is standard. Would all American Papyrus users please complain about this. On the plus side the American-English diction is available and does work. My writing can now be "organized" without being mispelled. (The dictionary works with 5.15 by the way, so all American Papyrus users should download the demo just for that.) Still no thesaurus. Still no footnote numbering with roman numerals or letters. Still no endnotes. I can only conclude that ROM does not have many users that do scholarly writing. The tutorial says to write them if you need this, but I did write them about it years ago.

ROM has added a WYSIWYG option in one of the menus. Unfortunately, it is not default. Any previous document you have is loaded showing carriage returns and other unnecessary elements. You can no longer outline the main editing area in grey without showing those elements--ugh.

You can no longer hide the toolbars. Not a big deal if you have a large display, but obnoxious at TT medium.

The big plus would be HTML import and export. I haven't had much chance to fiddle with that yet. You can also import and export in Word format. That could be valuable to those using Papyrus in the workplace.

Papyrus Base is part of the demo. My first reaction is that it is not as simple or as intuitive as Atari Works. Combine that with no manual, only a buggy help system, it doesn't make me want to use it.

In conclusion, unless you really need the HTML capabilities. There is little incentive to upgrade. Unless ROM fixes the display problems, I won't even consider it.

| >doesn't do (which is why it so usefully fast!).
|
|
| I think bad sectors are very nearly a thing of the past, some SCSI controlers do this

No, unless you mean by that the electronics card on the drive. SCSI controllers or
adapters as they are also called do not do bad block reallocation.

| trasparently, but if you have a drive that show bad sectors its probably time to bin it.

You need to make sure auto reallocation is enabled. For blocks that are past auto-
reallocation you can use the Format Unit command or the Reassign Block command.

If they are really freeware it's surely allowed.
You can always upload these programs to the incoming dir of the Belgian
ftp-server. ftp://chapelie.rma.ac.be/atari/incoming/

If you do please make sure the filenames are lowercase only. If possible
please add a small upload text (*.upl) in which you decribe in a few words
the program.

From: Chris Martin <hacked_up_radio@yahoo.com>
Message-ID: <393C0B0F.1539F54C@yahoo.com>
Source record: 61214

Actually, this should work if you only have either the PC or the Atari on

(not both). As long as the termination of the chain is okay, this should

work, and both computers should be able to read/write to this drive.
That is as long as you have all the correct drivers (such as HDDriver for

the Atari to read Win95 compatible partitions).

Now, also, there are SCSI drivers out there that allow "multiple
initiators". (If memory serves, this is what it is called). I know
there are Linux drivers that allow multiple initiators, or multiple
hosts, to be on the same SCSI chain. People have used this to connect
mutiple computers together via the SCSI bus and embed IP over
SCSI to allow for a small but fast network. However, I do not think
that such a driver exists for the Atari. So, your only option would be
to have either computer on at a time......

Regards,
Chris

Simply using a different view percentage fixes this for me. I use 86%
on a 800x608 screen. This displays the fonts at "normal" font
proportions and point sizes.

>The slight overscaling also seems to put the font
>engine at a disadvantage and makes the standard display harder to read. It

For me it seemed to scroll about the same speed as Atari Works, which
I am coming from, and in other ways it seems to work faster than
Works.

>Still no thesaurus.

This is definitely a disadvantage. I'd love to see a grammar checker
as well, to catch those nasty "their/there/they're" errors.

>Still no footnote numbering with roman numerals or
>letters. Still no endnotes.

I always did this the old-fashioned way anyway (physically typing
them onto the page), but this is definitely a needed improvement.

>ROM has added a WYSIWYG option in one of the menus. Unfortunately, it is
>not default.

You can make it default simply by going to "Edit Template", load
whatever the template you normally run in (_NEW.PAP for new page,

_HTML.PAP for HTML page, etc.), change the values you don't like (set the font, turn on WYSIWYG display, etc.), and save the template. Now any time you start up Papyrus or start a new page, it will be in WYSIWYG and other settings you want.

>Any previous document you have is loaded showing carriage
>returns and other unnecessary elements. You can no longer outline the main
>editing area in grey without showing those elements--ugh.

Not true when you do the above.

>The big plus would be HTML import and export. I haven't had much chance to
>fiddle with that yet. You can also import and export in Word format. That
>could be valuable to those using Papyrus in the workplace.

I've found some slight problems with the HTML editting (it doesn't display in CAB the way I tell it to on Papyrus), and I've heard that there are some Word format incompatibilities from someone here.

>Papyrus Base is part of the demo. My first reaction is that it is not as

True. It's ok, but now quite as easy.

>In conclusion, unless you really need the HTML capabilities. There is
>little incentive to upgrade. Unless ROM fixes the display problems, I won't
>even consider it.

For me, it still is a desirable upgrade from Atari Works. I haven't tried Tempus, as I can't get CAB to download more than 200k of the file, but so far, Papyrus is the best I've seen as far as Word Processing goes. Adds a lot of good DTP functions that Works lacks, which I sorely need. Makes "photo" printing possible and is much better at that than PageStream (which is makes a really poor, grainy, pixely printout of photos). I personally applaud ROM for this. I know they haven't produced much for us English speakers recently, but this shows a lot of hard work on their part (as well as their translators'). I think it's great!

Ekkehard,

Thanks. I thought that I had already done everything that you suggest,
but Magic still will not recognize the drive. HDDriver sees it. I must
be doing something wrong. More investigation is needed.

Does Magic care how many FATs you specify? I notice you let that
default, which seems to give 2 FATs.

The power system used by the PC should be the same as the Atari's (judging by a PC PSU I rewired to run and ST) just remember, for the PC black=ground red=+5v and yellow=+12v, which on an ST PSU black and red are the same but blue is +12v. I hope that helps.

There is an interesting discussion regarding this subject over at
comp.sys.atari.tech right now, and we have found out that it indeed is
possible. I'm not certain what you mean by "master", since that is IDE
terminology. You may have to play around with SCSI ID numbering, though, and
it is not certain that it will work on all controllers.

I have no idea, but why don't any programmers have a look at Christian Bauer's BasiliskII, the portable Mac II/Quadra emulator? It has been ported to BeOS, Amiga, several Unices and Windows. The Amiga version even uses the native 68k processor. It also supports many more features than the old Atari Mac emulators, which struggle at running even System 7 and lack colour.
The YggdrasilII homepage is located at

Curious! I had no trouble with the installation. Note that the
MAGIC_PC.OS is for the US 2.06 TOS only. the US 1.62 and 1.4
TOS have a different filename that I can't recall at the moment.

Yes he is. I talked with him alot and he always helped me and answered
my questions. I was one of the few who registered MPlayer and it still
resides on my hard drive.

There is a small tutorial that runs on a hard drive. There are
exercises and others things to do. I believe there are 8-10 lessons.

A couple questions about the TT's power supply unit.

Did anyone ever make a better one (more watts) ?
Is it possible to swap the guts of the PSU itself?

I really do not want to transplant my TT into a peecee case.
I happen to like it's odd looks ;-)

>to have either computer on at a time......
>
>

Actually I don't think is as bad as you think. I had my TT daisy
chained with a mac on my desktop while I was doing some testing. And the
TT could access the Mac hard drive while the Mac was on. The one caveat
as I understand it, is you have to be certain that only one device is
accessing a drive at any point in time. So if you are networking to a
windows box, you would not want to have your atari ever access the boot
drive of the PC or what ever drive the virtual memory was on. As it is
just about impossible on a windows machine to guarantee that it's not
going to access either one of these drives at any given point in time.

You could potentially make things a bit safer (I think) by making
a drive that was READ ONLY for the PC OS. You could switch this on and
off depending if the atari was on or not.

However don't get too heady with the rush of power. If you try to
access the host controller on the other system you will at least bring
that OS down in flames. At least this happens on the Mac ;)

But youre virtually doing this by starting your editor, selecting the drives etc. etc.

>It doesn't really matter which way it's done as the effect is the same.

Thats the bottom line, but for someone who cant work out how to achieve this without advice it probably better that he's not encouraged to edit a system file when he could use a simple no risk APP to acheive it.

It does too here and is selected, but this is a crappy default
font: it does not include the full unicode character-set.

> there are some Word format incompatibilities from someone here.

Icons (such as in a page's header) are not loaded correctly.

> but so far, Papyrus is the best I've seen as far as Word
> Processing goes. Adds a lot of good DTP functions that Works
> lacks, which I sorely need. Makes "photo" printing possible
> and is much better at that than PageStream

Here, I bought it mainly for two things:

1) RTF editing, including Microsoft extensions.
2) HTML editing in non-latin character-sets.

The first works rather well, the second doesn't.

Papyrus fills the HTML source with a _lot_ of garbage and
insists upon encoding everyting in Unicode, even though my source
document uses koi8-r. Mind you, I've offered my help to ROM for
testing any improvements in this area, so maybe they'll fix this.

Hi Terry,

>On the plus side the American-English diction is available and does work.
>My writing can now be "organized" without being mispelled. (The dictionary
>works with 5.15 by the way, so all American Papyrus users should download
>the demo just for that.)
The dictionary is 350Kb big, holding roughly 40000 words, this is unadequate
so you'll have to update it. When the dictionary holds 200000 words (the
minimum to work with a reasonable degree of comfort), you'll soon find out
that it's useless on a TT. It can take up to 15 minutes before the dictionary
is loaded into memory, and once that's done Papyrus can not keep up with the
typist....

>The big plus would be HTML import and export. I haven't had much chance to
>fiddle with that yet.
Don't believe it.. just load a simple html 3.0 file, edit a couple of lines,
save it again, and now load it in CAB, and find out how good it is...<g>

>Papyrus Base is part of the demo. My first reaction is that it is not as
>simple or as intuitive as Atari Works.
No it isn't, but comparing it to the crappy database from Atari Works is not
really fair, Papyrus Base is based on 1stBase, which is a very fast and very
simple to use database. Although it's simple in use it's very powerfull and
can easily do semi-relational tasks, ROM has managed to turn it into a very
clumsy and slow affair...
Not surprising really, Papyrus itself is also slow and clumsy, so I suppose
that's what's ment by "synchronised" applications ;-)

>In conclusion, unless you really need the HTML capabilities. There is
>little incentive to upgrade. Unless ROM fixes the display problems, I won't
>even consider it.
The big plus of Papyrus IMO, is that it can import M$Word docs, and that the
conversion to RTF is very good. But that's about it...

Cheers from Belgium
Dennis

I guess I don't quite understand what you're getting at. When I
select Swiss 721, it's the same Swiss 721 that I can get in Atari
Works, CAB, and any other font-using program (that recognizes GDOS
protocols). If I don't like it I just change it. I personally have
the Papyrus demo set to Dutch 801 as my default font, as I normally
use the serif font more often. I haven't found any characters
missing that I would use. I'm sure there are other fonts you can use
as well. If you're using NVDI, I've found lots of web sites that have
free TrueType fonts, as well as a number of places that sell disks
and CD's full of fonts.

HDDRIVER supports the SCSI driver's target interface which is a basis
for such a network. But there are no appropriate network drivers (e. g.
for MiNT) making use of it.

Indeed not, as the rest of your post showed.

OK, basically unicode features character spaces for every writing known to mankind. There is a numeric range for Roman alphabets (that's 90% of European languages), another range for cyrilic (Russian, Serbian, Ukrainian, etc.) alphabets, japanese Kanji, etc. all within the 32-bit addressing space of Unicode.

The Swiss 721 font that comes with NVDI doesn't include, for instance, cyrillic letters in its character range; they are omitted.

The Arial font on Windows includes the whole Unicode range that is currently ratified, and is regularly upgraded as other parts of the Unicode map are defined. For instance, at some point, the Euro's curreny sign was added to the range devoted to punctuation marks.

Later, as glyph-based languages are added (e.g. chinese, thai, cambodian, tibetan, etc.) in the Unicode definitions (the character ranges are already reserved), the font will be upgraded to include those glyphs in the character map.

This is the sort of things we have _yet_ to see on Atari.

So far, yes, but that is a lot in itself.

I really was interrested in the HTML editor, so I could produce
russian texts, but the amount of crap it stuffs in the HTML
source (e.g. one too many tags) makes it pointless.

Still, I contacted Ulli Ramps and offered my help to improve it.

It's not a rumour but they've been very quiet about it. Personally I
don't think that Basilisk will be that important for the Milan because
it won't work with the latest Mac software. And you still need the Mac
roms...

> (It would make it possible to use iCab ?)

Certainly. But why use iCab when you can use Netscape and MSIE on
Basilisk?

So you consider it a better/simpler approach to start an editor to add
the #[vfat]-section manually instead of running vfatconf.prg, which will
automatically add this line for you to magx.inf when doing the permanent
settings?

Ciao

Thomas

Anybody experienced a problem trying to run a .TTF file in
Pacifist 0.48? I've tried all of the TOS ROM files, so it's not
a OS problem. I've tried copying a disk image from my real
1040ST where a .TTF file works, but it won't work on the
emulator. Instead of getting the command line prompt, I get the
"Show Print Cancel" dialog. It's getting frustrating. So,
anyone else experienced this or know a work around?

The overlay for CAB that allowes 128 bitcoded SSL connection to your
trusted banker announces itself as Netscape I was told.

And that banks in the UK do not want IE5 as secure browser.

Now I hear from someone who had to buy a certificate and so on for
128 bit coding that only Microsoft has a license to sell abroad
(outside USA) and Netscape has not.

Why do banks not trust Microsoft? A backdoor maybe?

I got mine last week too - after 11 months as well, spooky!

I haven't got MiNT, however I've booted MultiTOS and it works fine
without tweaking.

Only problem so far I've found (quite a serious one actually) is that
you have to disable NVDI's screen drivers to get NVDI and fVDI to work
together, if you want to use NVDI for fonts and printing.

Unfortunately, this seems to play havoc with Papyrus Office v8 and the
font sizes are all wrong on screen. Papyrus formats the printed
output according to the screen display and therefore gets the line
lengths all wrong when printed. The right hand side of the page gets
truncated.

PS. I now want a 19" monitor.

Yeh, that's what you always says. I invite you to come over to my place
and see yourself how Adamas performs on my Hades. I gurantee you that
Adamas will crash within five minutes. It should support java script. I
guess this is a joke. Even the most basic java-script is able to crash
Adamas completely.
I surely hope newer version of Adamas will perform better. Apart from the
crashings the output isn't quiet good either. Lots of common used tags are
still unsupported. The display of some colorcodes are wrong too.
Somethings it happens that the vertical scrollbar just disappears.
....
....

Oh yes, you've told me already to write to the author about the problems.
I know someone who has done that. All what he got in return was a huge
mail saying that a battery of betatesters using all kind of machines and
OS's hasn't encountered the problems he had. He was advised to check his
setup and so on.
Oh boy I hate this kind of arrogant answers.

Ah! I see what you're saying now! :) I thought you were saying that there was a specifically Papyrus-only problem with font handling. Yeah, I did see that most of the Unicode grid in Papyrus was blank. I've always wondered if it would be possible (without owning a PC) to obtain the Windows fonts. I've seen them on sites displayed as freeware, but they are always in a Windows executable file, rather than Zip or other. Wouldn't that solve the problem if someone with a PC could Zip these supposedly freeware fonts for Atarians to use?

This is a bitmap font, so no. (If you could, you wouldn't like
the results anyhow.) Use a GDOS (like NVDI) and scalable fonts
if you need more control over your fonts.

Thanks for the reply. I do use NVDI and have some Speedo fonts and others
but don't care for them. I prefer the system font. Would you know which font
is the closest to the system font that could be used with NVDI?

Hmm, I can't get it to work with any combination of MiNT and an AES. Johan Klockars and Sven Karlsson are working on the problem right now.

> Only problem so far I've found (quite a serious one actually) is that

This is not a problem with fVDI, but NVDI. NVDI doesn't know that you have a graphics-card and loads it's own drivers. It really should detect this at run-time, but it doesn't.

I made a tiny program that enabled/disabled NVDI's screen-drivers automatically depending on whether Nova-VDI was loaded or not. This allows you to use both Nova-VDI & NVDI and NVDI alone without having to rename the drivers manually. I'm going to update this program to work with fVDI as soon as I can actually *use* fVDI myself.

> Unfortunately, this seems to play havoc with Papyrus Office v8 and the
> font sizes are all wrong on screen. Papyrus formats the printed

I've noticed that the fonts are very small too. This is probably because Johan has a very large monitor and has hardcoded the pixel-size in fVDI. This really should be configurable like in Nova-VDI, I'll mention this to him.

> PS. I now want a 19" monitor.

Me too... However, I'm knee-deep in debt right now (just bought a motorcycle! :-D) so it'll have to wait to 2014 or something.

>I happen to like it's odd looks ;-)

Bradley Koda of Best Electronics sells original MSTe/TT PSUs and his own somewhat improved version.

The latter is slightly cheaper because it comes without a case. You have to modify your existing case by removing the centre support of the circuit board.

I have been using an improved one in my TT for about nine months without problems. The original PSU failed with an over voltage condition.

Thanks for the input guys!

What happened here was I swapped gfx cards for a test
(identical cards) and simply left the test card in. Then I began to
get corrupted files on the internal drive. Since the machine
worked as it was for months fine, tracing back my steps I pulled
the gfx card and sure enough the corruption stopped. It never
issued one read/write error which is odd also. Anyway I assume this
card must be pushing the PSU over the edge slighly? Don't know
what else to think, the card works fine or seems to.

I heard a long time ago that the TT's PSU is not so good and that
a fully load TT runs near it's limit. Don't know if that is true, but I
pretty much have a fully loaded TT.

I don't want to pay much over the cost of a PC equivlent, if I cannot
find a suitable replacement I guess yanking the internal HD and
booting an external will solve it, thus less load on the PSU.
Not the best solution, but currently the cheapest.

I found it in their catalog 64 to 80 watts and $125 !
Don't know if that price is current, even so half that
seems rather high to me. I suspect I'll just yank the
internal HD and reduce the load. ;-)

6785. basic ? 'bout SCSI ports

Newsgroup: comp.sys.atari.st
Date: 2000-06-06 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <393dc654$0$1402@news.execpc.com>
Source record: 61186

Hello,

I recently bout a SyJet 1.5 removable which turned out for
me to be nothing more than a piece of junk.
I could not insert the cartridge. It was blocked by a white
piece of plastic protruding upwards.
Using a tool, carefully, I managed to depress the plastic,
like a physician checking ones tonsils.
After slipping the cartridge in, the drive would not spin
up properly.
Then the eject button wouldn't work and I could not get the
cartridge out manually.
So I promptly packed it up and returned it to the store I bought it
from.

Today I got a well made CORE 2000 SCSI. Nice metal external case,
spins up like a jet.

Well my question: On the Syjet the ports were marked SCSI in and SCSI
out.
They are not marked on the CORE 2000.
I thought the bottom port is in and top port out.
The guy that sold it to me said either port is in.
Is this true?

Thank you for your help

ken

6786. Edit track Now Freeware

Newsgroup: comp.sys.atari.st
Date: 2000-06-06 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8hhetr$t17$1@nnrp1.deja.com>
Source record: 61241

Hello All

Well... I finally did it. After 2 years of looking for Stefan Daystrom, I finally found him, and he gave me permission for a Freeware release of Edit Track!! It is now on my page. Try the mirror as it is more dependable. Having problems with my provider. It is under the HYBRID ARTS page. Check those other apps out as well!

The versions available are the BARE-FOOT versions. ver 7.10 as well as some "beta" versions provided by Randy Bender. (ver 7.1a, and ver 7.1B) the beta versions can be used as an Update to SMPTE Track, however you need the original SMPTE box for the SMPTE funtions to work.
Other changes to my site include a Link to the FILES section of ATARI-MIDI where you will find more shareware and Freeware releases like David Snows Midi Master Drummer and Midi Square(a mouse controller program much like Music Mouse)Also a LINKS page to Atari-Midi sites on the web.

Enjoy these great apps!

Tim
Conrardy

I would like to invite anyone of you to the Atari-midi mailing list.

Tim's Atari Midi World http://atari.atlantis-bbs.com
Mirror Site: http://sites.netscape.net/timconrardy/index.htm
Atari-Midi Mailing List:http://www.egroups.com/group/atari-midi

Sent via Deja.com http://www.deja.com/
Before you buy.

6787. Falcon System Fonts

Message-ID: <hRY_4.1891$yc6.50388@newsread1.prod.itd.earthlink.net>
Source record: 61242

Hi All,
In useing the font selector in CAB 2.7 on a stock Falcon MKI (14meg),
the point sizes to pick from range from 5 to 20 pt. If the 6x6 system font
is selected, the text size will change only with point sizes 5, 9, 10, 16,
18 and 20.
Can the in-between point sizes be realized with the 6x6 system font?
and, if so, how?
John G.

Hi All,

I have for sale the following items as a bundle. It tears
me up to let it go, but I need the room.

Atari Falcon 030 w/14MB RAM in near mint condition.
Includes:
- Original Box+Packing
- Original Mouse (Mint)
- Optical Mouse with Mouse Pad
- VGA Monitor Adaptor
- ST Monitor Adaptor
- TV Switch Box (Mint)
- Original Manual
- Card with setup instructions
- Original Disks
- Power Cable

External SCSI Enclosure w/2 bays (cabled for 3 scsi devices 50-Pin)
Includes:
- SCSI Cable
- Maxtor 120MB drive (Falcon Formatted w/some software installed)
- Power Cable

Software: (All original disks + manuals included)

Calamus SL
A bunch of BRE PD Disks of Calamus Fonts
ICD SCSI Pro Utilities 6.4.3
True Image
True Paint

Clarity Professional Sampler
Also Includes:
- DSP Hardware Board (plugs into Falcon DSP Port)
- RCA -> Mini_Jack cables

Books:

Atari Compendium - Sanders
Atari ST Internals - Abacus
Atari ST Machine Language - Abacus

Pictures available upon request.

I'm looking for $500.00 (Includes insured USPS shipping within the
lower 48 United States.)

Cheers,

-Kevin

From: ag352@chebucto.ns.ca
Message-ID: <8hhug8$kf4$1@News.Dal.Ca>
Source record: 61245

Hmm. I lost a TT power supply some months ago. I ended up going back to my 1040 STe (upgraded with all the ICD upgrades, but still an ST nonetheless) while I asked some questions.

Brad Koda from Best Electronics (oh, what is his website...? Ken? Tony? David? help me out here..) has some used TT power supples at a reasonable price. He also has some customized, remanufactured and generally beefier TT030 PSU's for a bigger price, but still reasonable IMHO.

I would have sent out my $$ to him some time ago but I have a chance to bid on a whole other TT where the PSU still works, for a good bargain.

He seems to be the best source. There was a rumour of a Mr. Wilner from Texas also into fixing or replacing the PSU's, but that was some months ago.

Good luck!

JG

No, I got an AT PSU for free in a local shop and hacked it in myself. If
you can find a PSU from a "pizza box" (like many Compaq PCs) that's quite
easy, because many of them are actually smaller than the original TT PSU.

Source record: 61097

Hy,
I'm planing to buy me a palm-based handheld. Since I use a Falcon at home,
I need some inforation about the compability, to make the decision which
model I should buy.
Does anyone know about a software to communicate between a handspring Visor
and TOS / MagiC? At least backup and softwareupload should be possible.
Is it principally possible to write such a software?
I know that the communiication between a Palm and an Atari machine works.
The Visor has only an USB-port. The communication should therfore go over
a docking station with a serial port. I don't know if the software that
works for the Palm also allowes contact with a Visor.

Has anybody experiences with this?
Are there maybe other handhelds that fit the Falcon better?

Greetings from Norway,
Thomas.

Hi

There isn't a need to swap the a/b selector on the drives.

Most external ST drives already have a twist in the cable so that yo
don't need to change the drive settings. Although it's a simple job.

The drive the person is on about is an external drive for and ST, not
and STF/STE/STFM..

You cannot use a 1.44 meg (high density) drive, pc style drive, WITHOUT
some form of modification. You can use a 720k pc drive though, just plug
in and go:)

Yes you can. You may have to adjust the jumpers in back before it will
work.

I am not sure about Hack, but if you cannot find it or any other
program to extract the images I know what I would try. Just bring up
TimeWorks and the file with the images. Then I would use a snapshot
program to take a picture of the images and save them in a format I
could use in Calamus. I have done that and it worked for me.

> comp.sys.atari.tech right now, and we have found out that it indeed is
> possible. I'm not certain what you mean by "master", since that is IDE
> terminology.

Actually this is not true ... with scsi you also have hosts and devices ..
the hosts are the controllers, and the devices are things like drives,
writers etc.

>You may have to play around with SCSI ID numbering, though, and
> it is not certain that it will work on all controllers.

generally said ... there cant be 2 commands at the same time ...
when a controller is not issuing a command over the scsi bus,
the bus is free for what ever wants to use it ... the problem might be,
that some older atari scsi "controllers" did not free up the bus
when they were idle, so with this ones it wont work.

else there is no problem .. i saw a linux driver to do ip over scsi .. aka
connecting
2 pc's via scsi ... and connecting an akai sampler to your pc scsi bus also
works,
the sampler (as a host) can use the scsi - cdrom drives and zip drives on
that chain.

my bet would be that for the original poster of this question, it wont work,
as
his scsi controller is really old .. i read something about the link 97 to
be
the first atari scsi controller to free up the bus ...

yours,
felix

Eclipse can only be bought from Cortex Designs (formerly Titan).
Tempest isn't available, and will only be made available depending on
how many Eclipse cards are sold. Cortex/Titan's home page is
http://www.titan-bss.co.uk/. This info I received directly from David
Encill just last week.

> anyone else experienced this or know a work around?

Save your desktop and check you have this line in your DESKTOP.INF :
#P 03 FF 000 *.TTP@ @ @

And keep the trailing space at the end of it! BTW it should be located
between these 2 lines:
#G 03 FF 000 *.PRG@ @ @
#F 03 04 000 *.TOS@ @ @

If you need more info, look here:
http://ftp.lip6.fr/pub/atari/Docs/Atari_TOS_Desktop_Survival_Kit

Well best guess anyway...

I have ported pilot-link to MiNT. I've attempted to port it to MagiC too
(together with Geir), but MagiC doesn't have tty's so there's a bit work
involved.

> I know that the communiication between a Palm and an Atari machine works.

You can buy a serial-cradle for the Visor too. This works exactly the same
as the Palm, so you can use existing software.

> Has anybody experiences with this?

Not directly, no.

> Are there maybe other handhelds that fit the Falcon better?

Perhaps not, but a different OS on your Falcon wil make it a lot easier
;-)

Does sound a bit steep. What voltages do the TT and Mega STe require.
Does it look similar to an ST/Falcon one. You could use a PC PSU -
cost is about 20 pounds 30 dollars (probably cheaper in the USA- like
everything else!).

When Papyrus is set to get it's font size for screen display from the
screen driver, the font comes out too small to read. So I have to set
it to 93DPI fixed. But this isn't quite right either as the font
sizes that are printed are different from the font sizes on screen
that Papyrus uses to format the output.

>18 and 20.
> Can the in-between point sizes be realized with the 6x6 system font?
>and, if so, how?

I am not sure but I doubt it - the system font is a bitmapped one and
only available in a few fixed sizes. I use Monaco Mono as my system
font, and that is available only in 8, 9, 10, 16, 18, 20 and 40 in
Everest, for instance. Note that all above 10 are really double-sized
(and 4x for 40) of the three smaller sizes, and so not very smooth.

For CAB do you not use NVDI and/or SpeedoGDOS? With those you can use
all the vector fonts, which are available in all sizes, and what's more
use proportional fonts which give a much better appearance and are
easier to read. You only need a monospaced font (I use Monaco) for the
last (pre-formatted) box. And note that the 'Size' box in CAB only
applies correctly to the 'Normal' body text, though changing it will
change all three font sizes.

Hi Steve!

I didn't say there was a problem - but copying with Kobold is
considerably slower on LFN partitions. I guess this only matters for
backups and similar large transfers.

You sure they're not talking about IE 5.5, and not IE 5 in general? My
bank (Wells Fargo) supports IE 5, but not IE 5.5, because it's still in
beta and they don't support beta browsers.

Thats an easy one! Just put them on a dos-formatted discs. Atari reads
Dos- formatted discs, However, PC does not read Atari-Formatted discs.
So use a 720K dos-disc, put it into the Atari. Transfer the files.
Stick the disc into the PC, and THATS IT!

Can you not just lift the fonts from a pc? I downloaded some new fonts from the Microsoft site, extracted them on a pc (at work I hasten to add) and transferred them to the Hades. They work with Papyrus 5 with no problems.

Hi,

I don't know what release of Stonx you tried, but i have got
the stonx 0.6.7-epsilon and this one seems to work perfectly.
I don't have sources, only a executable file and TOS.IMG 2.06
in French, which you can replace with another TOS for your
own language.

My Linux distribution is mandrake 7.0 currently.

I don't know if STWriter Publishing Partner will run correctly,
but if you want i can send to you a stonx tar archive.
Contact me by e-mail...

I guess that's something you configure in syslog.conf. I've always
prefered direct output (I'm a control-freak, besides I don't like
log-files which tends to grow into the sky over time) so I haven't noticed
any difference. I suggest you examine the man-file.

It very standard as far as voltages and such. I think it is identical
to the MegaST PSU, not sure on that. Only real difference is the metal
case size/shape with brackets/prongs which are used to secure it in
place.

That's a valid option indeed. The one from Best sells is not a drop in
replacement per say, it requires hand solding and such, at least
the catalog stated that. For $125 I'd expect it to literally drop
in, turn 2 screws and a plug or 2 and be done with it. ;-)
I will have to take some measuremnets of the metal housing, and have
a look at some up coming computer shows and see.

Syquest and ORB drives (and perhaps others) have auto-termination.
That is, if a connector is plugged into the out connection,
termination is OFF, otherwise it is on. Hence the connectors are
different.

Source record: 61137

It seems to me that there is a fair bit of mythology surrounding PSUs.

First, I don't think that there is, or was, too much wrong with the original MSTe/TT PSU. It was well made by an outside supplier that is still selling PSUs, so they cannot have had too bad a reputation. I have never had any sign of a problem with my MSTe, which has a Matrix Coco card in it, which puts a fair extra load on the 5v line, plus 68882.

Second, the PSU in my TT, with 64mb TT ram and Matrix tc1208, failed with an over-voltage condition, not under-voltage. Yes, it had a problem, but insufficient grunt was not that problem.

The Best Electronics replacements are not cheap, but you will always have to pay for a low demand, specialist item. I had already spent many hours going over the original PSU trying to find the fault. I decided to cut my losses.

Third, the components in switch-mode power supplies are not items in which great strides have been made over the past ten years. If they are getting smaller for a given output, it is largely because the components are being pushed harder.

The PSUs in STs and STes are not universal-voltage models, whereas the MSTe/TT supply handles 110-250v inputs. I don't know about the PSU in the Falcon.

Hi,

I have a Syquest 200MB removable. Every time I try to format,
it says "Check cable connections".
The scsi cable goes from the atari to bottom centronics port of Syquest.
I was thinking of using the top centronics port to try to format.
But it does not have auto-termination. There is a termination "on/off"
switch on the back.
I suppose what I could do is set the switch to off, plug the cable
in "top centronics port" and use a terminator on the "bottom centronics
port".
It would be my very last attempt to format the drive.
(Before I switch over to a differnt hard drive.)
Everything else has thus failed.

Thanks for your suggestions.

ken

All this means is, NVDI is capable of addressing characters in
the 32-bit range and to map Unicode entities.

It doesn't mean applications using NVDI will call those new
abilities, nor does it mean that the fonts will include the full
Unicode character-set's alphabet.

>The Milan II comes with Adamas (1.71 or later) and it works quite well
>for a lot of people.

Hello Matthias,
I must say that I was pleasantly surprised about the browser Adamas in version 1.71, which didn't crash anymore on my Milan (and that is important, it's going to be the official Milan II browser !) and was a lot faster on my Milan than version 1.63, which, by the way, crashed every two sites.
Regularly, just as on Martin's Hades, the scroll bar disappears and some colours are displayed wrongly
As soon as I activate "cache" or the Java Script Module in 1.71 the browser + Milan come to an immediate halt . Strange enough in 1.63 the cache worked fine on my Milan. The usual answer to this problem is "you configurated it wrongly". Well, I tried all the tips and tricks given, without results.
I desperately hope that those problems will be tackled soon and that Adamas will become a fine browser not only on some Atari's, but on all, just like Cab !

Cheers
Dan

> distance.

This looks like the geography differential between the US and UK.

In the UK the distances are much smaller, most people are probably no
more than an hour away from a public library, I'd guess, unless they
live somewhere really remote. Mailing books doesn't even enter the
picture!

> One thing I've noticed over the years, in life in general, is that the
> longer a person is involved in ????, and the more he/she knows about
> ????, the more intolerant many become when they encounter other people
> who are not as literate in ????.

In my case I'll happily admit to some intolerance: it comes from many years dealing with users who basically don't want to put in the required effort. Usually, not much is actually required (often just following a set of step-by-step instructions), but there are an increasing number of our users who think my job is to do their work for them: it isn't. I'm there to help *them* do their own work. So I'll happily show/advise them *how* to find the information they want, but I won't generally find it for them.

NB This is a different setup to a public library where the balance would be struck differently as you have a different clientele with different needs. In a university scenario (I work in a university library), students are supposed to be developing information and research skills: the best way is by practising them. Also, as they are on a university course they should by definition be posessed of a fully-functioning set of wits (assuming they haven't pickled them with alcohol/whatever, which is frankly their own responsibility!).

An example: we used to run drop-in sessions on how to use our electronic search tools, people could turn up at prearranged times during the week for a basic intro and the opportunity for some hands-on work with someone there to help out (usually a subject specialist). Takeup was next to zero (we've now abandoned them), yet we still had a constant stream of complaints from people saying they couldn't work such-and-such a database (or much worse: expletives deleted).

Now we have help sheets, and they won't read those either; they'd rather thrash about in ignorance and complain loudly than spend five minutes reading two sides of A4 which tell them precisely what to do. Even after you get said piece of A4 for them from the rack on the wall (with the big sign on it) and put it in their hands.

So now maybe you can see why at least one person here doesn't suffer fools gladly on the FAQ issue. In this context fool = someone who can't be bothered to find out about or read the FAQ, thereby ignoring basic netiquette, and then complains when directed to it.

> ::thinking:: Maybe that's what I've been reading as an undercurrent
in
> some of these FAQ posts that started this thread, a tone of
intolerance
> from a view. Maybe that's what bothers me about them.

From my perspective I think you have too rosy a view of human nature!

As others have said, we aren't here just to act as a poor man's help desk (though look at the trouble people go to to help each other in this ng - you could hardly say this is an unhelpful group of people), netiquette on this issue is long established and it is perfectly

reasonable to expect people to RTFM.

But these scripts were invented by little boys that never could have had a look
at real computers.
When Bill and K&R were little boys I worked on computers that used a subset of
Algol68 as system control language. A real programming language.
I've seen many people typing to DOS computers.
It never occurred to me as something I wanted to do myself.
Actually, I never did.

Dont forget that I was referring to a crew of a few thousand, all mumbling to
the same 'computer' at the same time.

I also just love a hilarious exaggeration. :-)

Pardon me, but how many fonts do actually support the full unicode set? I
can't see why anyone would generally complain about the lack of chinese
ideogrammes or cyrillic characters. Well, I'd really like Japanese glyphs
(though not without relevant input methods) and Russians might like the second
alternative, but that is really an uncommon feature among fonts.

Message-ID: <slrn8jrg54.gdv.mlake@melake.erols.com>
Source record: 61195

Has anyone here run STonX ? I'm having trouble.

I got it compiled [apparently] correctly. When I execute the resulting binary (stonx) I get a bunch of messages but none seem to be error messages. And I get a small white window (desktop) with no icons and no drop-down menu. I'm supposed to get these things, right? I also tried creating a disk image using the MSA archiver and running stonx with the -disk parameter but I still got the same thing ... a small white desktop with no icons and no drop-down menu.

What could I be doing wrong? Any help is appreciated.

I want to be able to run at least STWriter and possibly Publishing Partner. Do these programs work on STonX ?

It can, no problem. The German dic for example is much bigger, because
German
has much more word derivats, it's more complicated.

But why do you feel that the two dics aren't enough for a good start?

They come from Wintertree, and they do a very professional job selling
their dics to companies like us ...
>
> >Papyrus Base is part of the demo. My first reaction is that it is not as
> >simple or as intuitive as Atari Works.

It's a full relational database, but even there are points that are more
simple than in any other database, the search, for example - we guess,
as
easy as it even could be.

> No it isn't, but comparing it to the crappy database from Atari Works is not
> really fair, Papyrus Base is based on 1stBase, which is a very fast and very
> simple to use database.

Ah ... Not really. We took some ideas from 1st Base (by the way, with
the
best wishes of Oliver Victor, the maker of 1st Base - he totally is out
of
the programming business), but Papyrus is programmed totally new from
the
beginning, in early 1999, so there are lots of modern concepts in it,
SQL
compatibility in the programming, a very solid XML structure (ASCII
readable,
but still very fast), ...

And it can load old 1st Base databases.

> Although it's simple in use it's very powerfull and
> can easily do semi-relational tasks, ROM has managed to turn it into a very
> clumsy and slow affair...

More detailled, please? Papyrus is faster than 1st Base, which holded
the
records, till then ...

> Not surprising really, Papyrus itself is also slow and clumsy, so I suppose
> that's what's ment by "synchronised" applications ;-)

Hm? Silly, sorry. Papyrus is written in Pure C, completely, and totally
Atari-based.
It's fast, as well, when it is not that fast than 1st Word, then you
have
to look at the differences in concept, first - it is a totally SYSTEM
CLEAN
written application!
>
> >In conclusion, unless you really need the HTML capabilities. There is
> >little incentive to upgrade. Unless ROM fixes the display problems

?? Which one? There aren't any, you only have to look for your vector
scaler and there are several possibilities, sadly, for interpreting
screen point sizes, so maybe you have to play around with the
"Compatibility"
page of the "Options" notebook, but we don't know any system Papyrus
can't run on with any problems.

We did something about that, 8.20 is out, today (together with
some other fixes).
>
> Still, I contacted Ulli Ramps and offered my help to improve it.

Yes, thanks :-) But with unicode in HTML, we have to see when
we will find the time to do that; because there are lots of
other things to do, first, for example with the database part.

It was, yes - Hisoft tried to make a newer one, for a longer time, but
they never got ready.
So we had to do on our own.

On my
> >machine running Magic 5 and NVDI 4.11 the demo has a few problems. First it

What means? IS it in the Papyrus font selector or not? NVDI 4 ...
Maybe you have weird other fonts in your system? NVDI, specially version
4,
is somewhat very sensible about bad fonts.

> >Rom also appears to have changed how
> >Papyrus scales to the standard screen.

Sad, but true - we had to in correspondence with the Behne brothers and
their changes to NVDI 5. But this isn't a real problem, and it is a
DTP plus, because now it's more realistic.
>
> Simply using a different view percentage fixes this for me. I use 86%

> >may also be responsible for the slight sluggishness I noticed in the
> >scrolling compared to 5.15.

That's not true, there is no difference in, there, instead of you
decrease the Papyrus-internal Speedo-cache, what you shouldn't do
(in Papyrus 5 or in Papyrus 8 - no difference).
>
> For me it seemed to scroll about the same speed as Atari Works, which
> I am coming from, and in other ways it seems to work faster than
> Works.

It should, because the Behnes optimized NVDI for Papyrus and we did with
Papyrus for NVDI, in intensive co-work.
>
> >Still no thesaurus.

True. We think of that as being a wordprocessor overkill, but if there
are enough people out there who want one, maybe we will buy one for you.
>
> I'd love to see a grammar checker
> as well

Oh no, please. The only effort actual grammar checkers do have are
doing something for your sense of humor. ;-)

To make it REALLY useful one should program neuronal nets, but maybe
Ataris would be a little bit stressed by doing so ;-)
>
> >Still no footnote numbering with roman numerals or
> >letters.

Yes? What do you need?

> Still no endnotes.

True. We found that not really that much people really do need them,
so we did lots of other nice things, first.
We always listen, so if more people will REALLY cry for endnotes, we'll
do.

> >ROM has added a WYSIWYG option in one of the menus. Unfortunately, it is

> there are some Word format incompatibilities from someone here.

Sorry, but we cared for Netscape standards, first - HTML normally is
not only for Atarians ...

MS Word only has problems with some fast save option documents, but we
improve as often as we get weird MS Word docs.
>
> >Papyrus Base is part of the demo. My first reaction is that it is not as

I don't understand. We tested several beginners, and they found Papyrus
BASE the best usable database.

Combine that with no manual,

?? The manual is completely there ... Binary, as an online help
as well as a printable Papyrus document ...
We put LOTS of work in a very sophisticating manual!

Yes. Best way to handle MS Word, we think.

In my case, it locks up after
> approximately 38% of the file is converted.

Maybe you tried a "fast saved" MS Word DOC - we can't do them everytime
-
and even MS Word itself really is known to have lots of problems itself
with that format, so it's a very risky thing to use "fast save" in MS
Word.

So pass over MS Word DOCs that doesn't fit into Papyrus, and we will
have a look.

But even with the LINK97 TCP/IP over SCSI is impossible. This is only
possible with a full-featured SCSI bus, i. e. with TT and Falcon.
Adapters for the ST/STE's ACSI bus cannot provide all the functions a
real SCSI bus gives you. For standard applications such an adapter can
simulate SCSI using the ACSI bus quite well but sophisticated SCSI
functions like target control, SCSI messages etc. are not possible with
ACSI.

The TOS 1.00 UK image on the Little Green Desktop is not a UK rom, it's
infact USA

About Unicode they said:
[...]
>It does too here and is selected, but this is a crappy default
>font: it does not include the full unicode character-set.
>
I never met a full set. The biggest one I have in use is
Bitstream Cyberbit of 13 MB (yes Mb!).

And that one is empty for more then 70 percent.
I am missing hieroglyphs, Old assyrian, Linear A,
the traffic signs, Pali, etc.

Anyone having those? With the Font Utility on the atari (not in
existence on Windows as far as I know) I can glue fontsets together.

Met vriendelijke groet,
Ronald van der Kamp

About the unicode-content in fonts:
>Yeah, I did see that most of the Unicode grid in Papyrus was blank.
>I've always wondered if it would be possible (without owning a PC) to
>obtain the Windows fonts. I've seen them on sites displayed as
>freeware, but they are always in a Windows executable file, rather
>than Zip or other. Wouldn't that solve the problem if someone with a
>PC could Zip these supposedly freeware fonts for Atarians to use?
>
On Windows systems you find fonts, but these are extracted from basic
fonts on the CD. According to country specifications, parts are only
taken over to the Windows system itself.
But I found that getting the 'RAW' font from Windows as my Cyberbit
Bitstream of 13 Mb is a way to also use that front on a TT with NVDI,
Papyrus etc.

Source record: 61061
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

TAF Home Page: http://taf.atari.org
Ken Macdonald, TAF President + Mario Becroft agent: 416-533-0504 or anarkist@idirect.com
Dan Dreibelbis, TAF Vice-President and Sinclap Tamer: 416-766-4743 or dreibel@idirect.com

You need a resource editor, and to change the newdesk.rsc file to add new
icons. There is a limit though, but I can't remember what it is.

Midifiles are a cross-platform standard. As you said, just stick them on a
disk, but make sure it's a 720K DD DOS formatted floppy.

Incidentally, this is in the Quick FAQ: http://bales.online.fr/atari

New version of MyMail 1.00 will be released at NAS.

In version 1.00 a big work is put down in getting
all existing functions as stable as possible
and on optimizing the code to get it faster.

Do visit the show if you can or download the new version
from my site when it is released.

I think we are both incorrect.

The SCSI spec does not define a 'SCSI controller'.
What you refer to as a 'SCSI controller' is called a 'peripheral controller' (also referred to as 'SCSI Device') or a 'target controller' or a 'device controller'.

My IBM SCSI drive manual only mentions a 'SCSI Controller Chip' as opposed to 'Buffer Controller Chip' and they both sit on the device controller board.

What I referred to as SCSI controller or adapter is called a Host Adapter.
The 'Host Adapter' is also referred to as a 'SCSI Device'.

Where I come from (minicomputers) a controller was an interface with onboard intelligence. It sat in the computer. A Host Adapter would fit such a description.

|Hey, that's not meant to use it that way ;-)

No? Until System Solutions have Papyrus 8 to sell to their UK customers, that's the way it has to be done :-(

Seriously, I am delighted to see ROM Logic starting to interact with this newsgroup. It is a very welcome change to see developers responding to their customers, potential and actual. I hope that it continues for the benefit of all.

| Syquest and ORB drives (and perhaps others) have auto-termination.
| That is, if a connector is plugged into the out connection,
| termination is OFF, otherwise it is on. Hence the connectors are
| different.

The out connector will have a sense line on one of the signal row ground
connections, the in connector has not. When that sense line gets grounded
when you attach a device the inbuild terminator will disable.

Atari treated Australians as English English speakers rather than
American English so Ataris were sold here with UK TOS.

I still have the 6-chip TOS 1.0 that came in my 1040STF and which
would run the original software PC-Ditto.

My experience with PC-Ditto somewhat cooled my enthusiam for
emulation, so making an image of TOS is not one of my skills. In any
case the chips are not in the computer. I have an eprom programmer
which might be persuaded to read them if I can remember how to use it.

Where to from here?

Hi David

>Third, the components in switch-mode power supplies are not items in
>which great strides have been made over the past ten years. If they
>are getting smaller for a given output, it is largely because the
>components are being pushed harder.

You obviously have no experience of Switch Mode PSU's, i can assure you they are very Hi-Tech pieces of equipment, the components are not over run, on the contary, a state of the art FET chopper PSU is a very much under stressed, very efficient piece of technology.

Take a good hard look at a modern television, average size these days 30 inch CRT, probably a 5 AMP drain on the Line Scan circuit alone, and still having waste energy utilised with flyback control, a Dolby Stereo audio system, 50W per channel peak with 5 channels is the norm these days, teletext, Remote control, and you'l find the Primary PSU is probably smaller than in your faithfull Atari ST, and still utilise a 5 volt driver chip and an FET to produce 5V, 12V, +&- 24V, 70V and 150ish volts for the LTB HT, and still only 75W drain on your electricity supply.

Yes you guessed it, i repair them for a living.

You cannot execute a font file, TTF is a font designation, do you mean TTP or are you confusing yourself with the TTF vs TTP extenders.

Of course, Papyrus 8 does, as well. Whatever fonts are installed
properly to any Atari system (best with NVDI), Papyrus takes.

But be aware of lots of lousy fonts, specially cheap TTF from the
Windows world. They often make vector font scalers behave weird, same on
Ataris as on OS/2.

But Papyrus does - no wonder, because we worked together strongly with
the Behne brothers to implement unicode in NVDI ... :-)

Papyrus internally is fully unicode enabled.

True, Cyberbit from Bitstream (full unicode set) for example takes
somewhat 8 MB ...

And Swiss 721 I expect to be the most common font allover all Ataris, so
I used that one to be our default, so that the minimum of users have to
exchange fonts.

Sorry, but that's not true ...

There are several levels of unicode sets, and Arial fulfills more
than Swiss 721, but the full range only is set up in two fonts
I owe, first Cyberbit from Bitstream and second another one, a
Times derivat, if I remember correctly.
But those fonts are around 8 MB big ...

> Later, as glyph-based languages are added (e.g. chinese, thai,
> cambodian, tibetan, etc.) in the Unicode definitions (the

The definitions are there for years - but nobody would implement
a 8 MB system font, if not neccessary ... Who of us need Kanji,
and Arabian characters, and Thai, and ...
>
> This is the sort of things we have _yet_ to see on Atari.

Take Cyberbit! From time to time you find it on the Bitstream
homepage (don't know the URL by heart, yet) ...

6889. fVDI/NVDI/Papyrus problems

Newsgroup: comp.sys.atari.st
Date: 2000-06-09 00:00:00 UTC
From: osian@zetnet.co.uk
Message-ID: <39415479$0$31676@news.zetnet.co.uk>
Source record: 60997

I've recently taken delivery of Cortex's Eclipse card (with its driver software fVDI) and Paprus Office. However I've had a frustrating week trying to get them to work with NVDI.

I'd like to know if anyone else is using the same combination and has encountered the same problems, or maybe it's just me and my setup. I've tried tweaking all the options in each piece of software but there are millions of combinations and I haven't managed to find anything that works. I'd be grateful for any comments before I send this mail to the relevant parties.

If you want to run fVDI and NVDI together (because you want to use vector fonts or the NVDI printer drivers), the NVDI screen drivers named NVDI*.SYS have to be deleted or renamed. This probably causes some of the following problems.

1) Both CAB and Papyrus Office display vector fonts much smaller than they should be. With Papyrus inparticular, printed output is then all wrong, as presumably Papyrus formats lines according to the display (as it's WYSIWYG). I suspect it's getting zero from NVDI as the font width. When printed, the lines are infinite in length and get truncated on the right. To fix this, the Compatibility option for Display in Papyrus has to be changed from "Default" or "Inquire from Screen Driver" to "93DPI fixed". Although text is then readable on screen, I think this is still slightly smaller than what they should be. Lines are still truncated on the right when printed, although only by a few characters this time. An existing document created in Papyrus Gold and NOT reformatted in Office displays lines shorter than they should be on screen but they print OK. When the document is reformatted in Office, the lines fill the whole page width on screen but get truncated again when printed. Also, a right-flushed section on a page (for example, an address at the top of a letter) doesn't align properly and the right margin is slightly ragged.

2) In colour planes greater than 8-bit (i.e. > 256 colours), the desktop colours are wrong; the system appears "jerky" sometimes; a repaint after a dialog box disappears sometimes takes a long time; CAB displays some GIFs with the wrong background, possibly those with a transparent colour other than the background colour although I haven't been able to prove or disprove that. Try my home page for an example! The Welsh flag in the top left corner displays wrongly, so does the Zetnet logo at the bottom of the page.

3) When fVDI is set to use colour planes greater than 16 (although it's difficult to find the right combination - the card should be able to handle 800x600x[32/24]@80 but it doesn't and reduces the colours to 8-bit) the icons on the desktop disappear.

4) Closing dialog boxes and windows very often doesn't repaint the background properly and leaves it unreadable.

5) The bottom 10 lines or so of a screen (I'm using 800x600) never repaint properly. For example, maximising (sorry, Windoze terminology) a window and then reducing it again leaves part of the window at the bottom of the screen.

Further information - I've just tried disabling NVDI and installing
SpeedoGDOS instead. Papyrus Office then works fine. However:

1) I get Monaco fonts instead of the system fonts!

2) I cannot use Truetype fonts.

3) CAB doesn't seem happy with NVDI not being there - it doesn't
display any SpeedoGDOS fonts, although it lists them in the
dialog, and it positions some images *outside* the window not
on the web page.

4) There is no printer driver for my colour Canon BJC-4650.

Have DSP clock adapter with it? If not it's worth even less I suppose,
as it cost like $30 to get one.

Ofcourse, since SpeedoGDOS only handles Speedo-fonts ;-)

As for your other fVDI-problems: I haven't noticed anything particular except that it doesn't work under MiNT, and that some programs that writes directly to the screen has a few problems. I haven't seen your redraw-problems, but it sounds like you should try to switch off the screencache and imagecache. If you use the screencache, make sure that fvdi.acc is installed!

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your reading for my Free catalogs, jump to the bottom, otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet & some Cartridges for the ST like DVT VCR, ST Replay & Computer Eyes! So come and Get it! First come, first serve.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, &

my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

6899. The Atari scene now (ex Atarian)

Newsgroup: comp.sys.atari.st
Date: 2000-06-09 00:00:00 UTC
From: Paul Shayler <paul@g6tsf.demon.co.uk>
Message-ID: <ant0918120b0Kjhw@g6tsf.demon.co.uk>
Source record: 61007

Hi Atarians,
I used to run an Atari ST until back in 1996 it suffered a fatal
failure. Feeling nostalgic, I was wondering what's going on in the
Atari scene these days.

How are things with web browsers and other internet applications.
No doubt - Java, Javascript, SSL128, Real Audio, etc are now common.

I at one time used CAB and the internet software, that I think was
called OASIS, but was not really developed after so much being promised.

I have moved on to an Acorn StrongArm Risc PC, which has an Atari ST
emulator availiable, I have used it a few times with a few old progs I
had, it runs TOS 2.06.

Regards, Paul.

6900. Re: converting atari midi files to pc?

Newsgroup: comp.sys.atari.st
Date: 2000-06-09 00:00:00 UTC
From: brian@gem.win.co.nz
Message-ID: <FvwrFA.Fv@gem.win.co.nz>
Source record: 61008

David Young (dbombay1@earthlink.net) wrote:
: Does anyone know how to save midi files from an Atari 1040st so that they
: can be loaded into a pc platform....Win 98.

I have read the other replies you have had to this question and I can give you a different experience.
Exactly this question was only days ago put to me by a club member here in New Zealand. But it did not go the way that the other people replying think. Maybe it does work for you, but I
would say you should try it out as per the other suggestions as this is the standard answer -
but do not be surprised if it does not work. Because it did not work in my most recent example.

The situation was that a chap had purchased some MIDI files a while ago and could use them on
the Atari. They were commercial MIDI files which cost $100s and were on PC discs.

Now he is on the PC, rather than the Atari, and he has found that he can not load the MIDI files onto his PC - he gets no entries or funnny characters.

The critical thing to understand is that he has Win98.

He sent the discs to me and I found they loaded fine into the Atari and the PC - but the PC was running Win95!

And I have heard other vague stories about strange incompatibilities between Win95 and Win98
and/or Atari.

In this case it did appear that the problem was not the Atari at all, but some difference between Win95 and Win98 as regards floppy disc format.

It is a mystery.

The result was that this man could not get his MIDI files that would load fine on his Atari,
into his PC.

He formatted some discs on his PC and then using his Atari, copied the MIDI files onto these
discs. But! still they would not be read on the same PC that had just formatted them.

I am not an expert on this subject, but I know there are some issues, one of which I have described.

The answer I worked out was to simply send me the discs in the mail and I then zipped them up

and sent them to him as an attachment.

Also, another method I have used is for the person to send me the files which I then resend him using the same method - this is typically when the user has music files that are not native to the PC, but from which MIDI files can be extracted on the Atari.

So this person who has Win98 and wants to get his MIDI files across - I would be interested to know if you have the same problems which we have just had here.

I think you meant 'deskicon.rsc' for the (smaller) mono icons
color icons are in 'deskcicn.rsc'

This won't happen that fast, because they are very slow in giving
concepts for how to sell, what to sell, and so on ...

So at the moment the only way to get hold of an English Papyrus is to
buy it directly from our homepage, and you will get it quite fast as an
email attachement of around 4 - 5 MB, payment via credit card.
>
> Seriously, I am delighted to see ROM Logic starting to interact with
> this newsgroup.

After this huge bulk of work we had with the translation, it's a
pleasure, and I'll be here several time a week, I guess.
But not this weekend, because we have an Atari fair in
Duesseldorf-Neuss, this weekend :-)

> It is a very welcome change to see developers
> responding to their customers, potential and actual.

That's what we are known for in Germany, and that's what we love to do.
And we feel, as well, that persons "standing in the line" - like the
former HiSoft or the maybe-distri System Solutions - take us away from
our customers (not by will, but by logical processes), so we think we
should get involved a little bit more into the English markets.

So we did the translation on our own (with the help of native speakers,
of course, but not with the help of any distris), and we want to make
the customer support, as well (via internet, it's much more easy to do
so, in this times).

> I hope that it
> continues for the benefit of all.

So we do :-)

Yes it is possible. I have created many icons from scans and other
picture files. If you are using Jinnee or Thing, you will need a
resource editor. It you are using EASE, then you will need nothing as
it has it's own icon editor that can load in IMG and RSC files.

Hi,
Sri for delay in replying but I have been ill and offline.
Trouble is, I'm in Hertford England so even if we came to some
arrangement over price transportation costs would probably be
prohibitive.
However, your interest and comments much appreciated.
Steve

Hi,
I have my Atari Center finished.
Here , you have demos, games, softwares, etc.
Also, i am looking for a Dongle for Cubase 3.10.
If someone could help me? or has plans, diagrams, etc.
Drop me an email.

I have a disk here says "CUBASE program disk" from Steinberg, on the back it
says version 3.1
What is this worth, or is there another disk I am missing?

Thanks!!
Jon

Hi

Just to clarify things. The program itself is worth nothing without the
Dongle. The Dongle is a cartridge that plugs into the cartridge port.
The Software itself is available on FTP sites as a free download.
(cubase 3.1 as well as other updates) However for any of that to work
you need the Dongle. Sorry to dissapoint you there.

6914. The Nordic Atari Show

Newsgroup: comp.sys.atari.st
Date: 2000-06-10 00:00:00 UTC
From: Nordic Atari Show 1999 <nas@goteborg.utfors.se>
Message-ID: <960624352-35943AEicMi@goteborg.utfors.se>
Source record: 61010

```
Swedish Atari Association (SAK)
The Nordic Atari Computer Show 2000 (NAS2k)

Edition 2000 June 9th

------------------------------------------------------------------------

INFORMATION ABOUT NAS 2000

------------------------------------------------------------------------

T H E N O R D I C A T A R I S H O W 2 0 0 0

------------------------------------------------------------------------

Hi there!

The Swedish Atari Users Association (SAK) is proud to announce we are
again hosting this years show in Gothemburg.

The Nordic Atari Show in its sixth year and is the only all Atari show
produced in Scandinavia. The show has proved very popular for Atari
enthusiasts in Northern Europe.

Space is available for inviduals, companies, clubs and organizations
producing Atari related products and services.

If you know of any vendors, suppliers, anything Atari related that you think
belongs at this show, let us know.

Help us to get the word out about this show.

------------------------------------------------------------------------

>> PLACE
Sinpro in GOTHENBURG
Bror Nilssons gata 5 - Lundby strand

>> TIME
16th - 17th June 2000
Friday June 16th 1700 - 2000
Saturday June 17th 1000 - 2100
Sunday June 18th 1000 - 1500

>> HOW TO GET THERE
You can find road directions at the associations website
www.sak.nu/ click the link named Nordic Atari Show. The
address can of course be reached via other media such as
a Gothenburg phonebook, local maps or at
http://www.vasttrafik.se/fr_online.htm. To find your way
the last few meters you can always call the designated
```

phonenumber for the convention.

>> THEMES
Like last year NAS2K has the main theme "networks". This
also gives you a possibilty to bring your own computer
and attach it to the local network.
It is also the associations 15th birthday.

>> ENTRANCE FEE
60 SEK per person and day
100 SEK per person for 2-3 days

>> NAS2K INFORMATION
http://www.sak.nu/
Click the link named Nordic Atari Show

>> BBS
STraight BBS +46 (0)31 340 15 48 (v.34 och ISDN)
+46 (0)31 340 15 49 (ISDN)
(SysOp Bertil Jï¿½gard)

>> LODGING
Lodging can not be accommodated at NAS. The building has
an alarm on during the night. Contact the board if you need
accommodations.
There are possibilities of lodging at several of the
board members.

>> NAS PHONE
0705-23 38 30 (Jonas Mï¿½ller-Nielsen, head of NAS2K)

>> E-MAIL

The Nordic Atari Show 2000 (NAS2k) is situated at the edge of Gï¿½ta ï¿½lv
right in downtown Gothenburg, on the Hising side at Lundby Strand.
There is boat traffic (ï¿½lvsnabben) over the water, and it costs the same
as community traffic. There is also bus 19 to Eketrï¿½gatan which stops at
Gï¿½taverksgatan (NAS2k).
There is also a big parking lot outside NAS where parking is free.

<info>----------
Mille Atari Website http://surf.to/atari
- Swedish versions of ASH Internet apps
- Mille at Home http://user.tninet.se/~gcc561r/athome/

A cafeteria will be open during NAS. There you will find coffee,
Coca Cola and hot dogs. We will also accommodate certain food for
heating in a microwave.
Here you can also watch Soccer EC.

<info>----------
MyMAIL by Erik Hï¿½ll http://www2.tripnet.se/~erikhall
- E-mail app that runs under STinG or STiK
- MyMAIL version 1.0 will be released at NAS 2k

>> SEMINARS
Exact contents and time scheduals will be put up at NAS.
1300-1900 Saturday

>> SALE
People have always been selling all kinds of things Atari-related at

NAS, and you can do it too. Just bring along whatever you want to sell.
Note that you will have to handle receipts and cash yourself, and you
are responsible for what you bring.

>> DISCUSSIONAREA NETWORKS
Preparations with help from network connected computers prior
to NAS takes place at one of the associations memberlists on the
Internet.

> than they should be. With Papyrus inparticular, printed output

As was mentioned in another message, this is (most likely) because fVDI
currently sets a fixed size for the screen pixels. I'll fix that shortly.

>2) In colour planes greater than 8-bit (i.e. > 256 colours),
> the desktop colours are wrong; the system appears "jerky"

Hmm. I run in 16 bit mode almost all the time and the colours are
definitely right here. Try running RECOLOUR.PRG and see if that helps.
You could also try the 'nopalette' option and see if that changes
anything (it really shouldn't).

What do you mean by 'jerky'?

> sometimes; a repaint after a dialog box disappears sometimes
> takes a long time; CAB displays some GIFs with the wrong

You should be glad that not all dialog repaints are slow. ;-)

The default settings for fVDI should normally be to cache blits that
seem to be background saves (such as for menu drop downs and dialogs)
in the RAM on the RageII itself. This is _much_ quicker than actually
doing the blit to the Falcon RAM (which is what all other VDIs have
always done).
The AES background buffer caching, which should always be safe to use,
is not effective for some programs, however, which do their own
buffering. In that case, 'screencache' will often do the job, but it
can cause redraw problems with some programs.

If the above does not seem to fit in your case, please let me know
of a program where I can duplicate what you're talking about.
Even without the caching, it should't really feel like it's taking a
'long' time (unless you're running without 'pcibios' and 'doblit' does
the redraw a pixel at a time...).

> background, possibly those with a transparent colour other
> than the background colour although I haven't been able to
> prove or disprove that. Try my home page for an example! The

I will do that.

>3) When fVDI is set to use colour planes greater than 16 (although
> it's difficult to find the right combination - the card should
> be able to handle 800x600x[32/24]@80 but it doesn't and

There is currently no 24 bit support whatsoever in fVDI/RageII.

The frequencies available in 800x600x32 are (currently):
56, 60, 70, 72, 75, 85, 90, 100, 120

If your selection doesn't fit any of the above, fVDI will select something
that is 'similar' but 'lower'. That is, it won't select the 85, which
could potentially be harmful to your monitor.
(There is no 80 Hz mode available at any colour depth.)

AFAICR, in this case 800x600x32@75 should have been selected, but there
might be something wrong with the 'fallback' algorithm (or I might have
constructed it to drop down in colour depth before frequency, although
that doesn't seem like all that good an idea).
I'll check it out.

> reduces the colours to 8-bit) the icons on the desktop disappear.

Unfortunately, the original desktop can't deal with 32 bit icons (it
handles them with the same code as the 8 bit ones, rather than with the
16 bit code, which would have worked better).
You can get the icons displayed by activating 'onlysrc', which will make
all blits use the D=S method and thus disable the masking the desktop
tries to do. Of course, this will affect other programs to.

>4) Closing dialog boxes and windows very often doesn't repaint the
> background properly and leaves it unreadable.

Hmm. I've only seen that with the 'print/show/abort' dialog, which
is difficult to debug since the desktop code is in the ROM.
If you've seen this happen in some ordinary program, please let me know
which one. I'd also be interest in ways to expose the problem without
using the above dialog.

Anyway, these kinds of problems should go away if you turn off the
AES background buffer caching (don't start the ACC), but that isn't
really recommended since it slows things down so much.

>5) The bottom 10 lines or so of a screen (I'm using 800x600) never
> repaint properly. For example, maximising (sorry, Windoze
> terminology) a window and then reducing it again leaves part of
> the window at the bottom of the screen.

I've never seen that (but then I'm using 1024x768 or 1152x864 most of
the time). I'll check it out.
I take it you mean this happens with all programs, including the desktop?

>directly to the screen has a few problems. I haven't seen your

Yes. The frame buffer on the Eclipse/RageII isn't in any of the formats
expected by some programs that insist on doing the drawing themselves,
unfortunately. The bank switching (which is what enables the Eclipse
to work on Falcon's with 14 Mbyte RAM) can also cause some extra problem,
especially with an AB040 (due to the way writes are restarted rather than
continued after a bus error, causing an infinite loop of bus errors...).

Programs that check the screen layout in a reasonable way (preferably
using the new VDI calls introduced by NVDI) and use the VDI for the
actual blitting are fine.

>redraw-problems, but it sounds like you should try to switch off the
>screencache and imagecache. If you use the screencache, make sure that
>fvdi.acc is installed!

'screencache' is the one that caches blits from the screen that don't
go to the AES background buffer. These are often just background saves,
in which case the caching will work fine. If some program tries to use
the blitted data for anything it won't work, however, (since no data
was actually moved into normal RAM). This includes trying to blit back
the same area twice.

'imgcache' caches blits going to the screen, if they are 'icon sized'.
This can speed up desktop windowing drawing quite a bit and I haven't
seen any program that doesn't work with it.
Problems would occur if some program modified a memory area already used
for a RAM->screen blit and then tried to blit the new image.

The ACC is mainly involved in the AES background buffer caching, which
is separate from the above (they should work without the ACC).
This caching should normally be quite safe but, for whatever reason,
it causes MagiC to draw all its icons incorrectly.

What about supporting "plug & play" monitors? IIRC it will tell you how
large the screen is, so you can calculate the pixel-size automatically.

Ulli mentioned that Pap's speller was from Wintertree. Why not buy
their grammar checker, I believe they have one.

Thanks for your reply Johan - I haven't got time at the moment to 'think' too much about what you said as I'm going to be away most of the weekend, however some quick answers:

>Hmm. I run in 16 bit mode almost all the time and the colours are
>definitely right here. Try running RECOLOUR.PRG and see if that helps.
>You could also try the 'nopalette' option and see if that changes
>anything (it really shouldn't).

Someone else who's had an Eclipse since last summer also said that the colours went wrong and he's using RECOLOUR - but it's strange that it's fine in 8-bit colour and then goes wrong in 16-bit. Where can RECOLOUR be found?

The 'nopalette" option doesn't seem to be documented, along with something else you mentioned later...

>What do you mean by 'jerky'?

Opening a window can sometimes pause for a second before doing anything then carry on as though everything was OK. A bit like Windows behaviour actually!

>You should be glad that not all dialog repaints are slow. ;-)

Yeah, again it's strange but sometimes it's OK, other times you can see the lines being drawn. Only in 16-bit colour though.

>If the above does not seem to fit in your case, please let me know
>of a program where I can duplicate what you're talking about.

I'll experiment later and let you know the results.

>Even without the caching, it should't really feel like it's taking a
>'long' time (unless you're running without 'pcibios' and 'doblit' does
>the redraw a pixel at a time...).

It's not quite that slow! I have sene the effects of turning off doblit and it's not as bad as that.

>There is currently no 24 bit support whatsoever in fVDI/RageII.
>
>The frequencies available in 800x600x32 are (currently):
> 56, 60, 70, 72, 75, 85, 90, 100, 120

This is another example where this information isn't documented. The pamphlet that comes with Eclipse does give the possible bit planes, but is contradicted by Titan's web site I think, and I was also

confused by the fVDI site. I also haven't found anywhere that lists
the refresh rates possible, which maybe explains why I was getting
inconsistent results.

6924. CT2 rev A through-port pin-configuration

Newsgroup: comp.sys.atari.st
Date: 2000-06-10 00:00:00 UTC
From: Henrik Gildå <di98gihe@chl.chalmers.se>
Message-ID: <39424D1E.3949BA1F@chl.chalmers.se>
Source record: 61020

Hi!

I have a CenTurbo2 revision A in my Falcon, and recently got the Eclipse I ordered 9 months ago(!). :-)

Of course I now want to use the CT2A and the Eclipse in the same computer, but the problem is that the CT2A has really lots more through-port pins than the Falcon motherboard, so I don't know where to insert the Eclipse. I contacted Rodolphe Czuba about this, but unfortunately he didn't have the CT2A pin-configuration anymore, and it is gone from the Centek homepage. So does anybody out there have it?

One other option Rodolphe mentioned was to solder my own through-port on the Eclipse directly, and then put the CT2 on top of it, but that is certainly my last alternative since I don't want to ruin my Eclipse.

Regards,
Henrik Gildï¿½

6925. 16MHZ cached 4MEG 520STE for sale £115 including insured postage

Newsgroup: comp.sys.atari.st

Source record: 61021

Ok first the STe. Its in fantastic condition fully working, has the nice glossy keys and enlarged feet meaning its slightly higher off the surface than normal STs. This looks really nice.

It runs faster than a MegaSTe (just slightly) but has full compatibility with games etc.

It has TOS 1.62.

Because it has a standard TOS and a 68000 at 16MHZ it still runs most games and demos and if it doesn't (which is rare) then just switch it back down to 8MHZ.

Remember ST 3D games that chug a bit making them unplayable. Well this STe sorts them out. Games like Battle Command as one example run at a proper speed at all times.

It really sorts out the STe game wise.

Obviously still great for apps etc.

Includes books, mags, software, joysticks and monitor adaptor.

I realise its a high price but don't want to sell for less so would rather keep than sell cheap. However I honestly think this is the nicest STe out there as its condition is excellent.

Would also consider swops like a Dreamcast or possibly N64 carts in p/x. May even consider PC hardware.

UK only.

Beyond my capabilities,

so what we need is some brave hearty soul who could
assemble a Netscape/Mozilla version that would
work with the .mpeg, .mov, .avi etc players we
already have and acknowledging that we
just might have to give up the features that are in
say, Macromedia Shockwave, QuickTime or what ever.

I admit I'm not up to speed on what is available to
Atari/Atari clones at the moment as I use this Windoze
box to peruse the net, on the other hand I tend to keep my
irreplaceable data on the Atari in knowing that all
I have to do is save to removable media.

>resides on my hard drive.

I too registered MPlayer, as it plays movies much better than Aniplayer!
I've never really got Aniplayer to work properly, the sound and graphics
don't stay in sync, ie the sound plays normal speed, but the graphics
don't! :(

Cheers!

Please let me know if you get the CT2 working with the graphics
card. After installing the Eclipse I now have a spare Nova that I want to
use in a second Falcon. However, I need either an AB or a CT2 (depends on
what I find and what it costs) too, as a 16MHz 030 with 4Mb RAM is a
little limited after having used the Afterburner for almost 3 years...

In the distribution archive of fVDI v0.95 (the SUPPORT directory, IIRC).
You can find that via my WWW site at http://rand.thn.htu.se

>The 'nopalette" option doesn't seem to be documented, along with
>something else you mentioned later...

They are documented in the FVDI.SYS that's included with v0.95.
The files distributed by Cortex seem to be ten months old or so...

>Opening a window can sometimes pause for a second before doing
>anything then carry on as though everything was OK. A bit like

Does this happen with specific programs or can it even happen with
the desktop?

>
>This is another example where this information isn't documented. The
>pamphlet that comes with Eclipse does give the possible bit planes,
>but is contradicted by Titan's web site I think, and I was also

Well, I think part of the information is regarding the RageII itself,
and part regarding the actual Eclipse/RageII/fVDI combination.

It's certainly _possible_ to get update frequencies in between those
above, but we 'cheated' a bit and just dumped the values used by the
Windows driver. ;-)

It would be possible to make a 24 bit mode available, but it isn't as
well supported when it comes to hardware acceleration using the mach64
engine. The resolutions you can use in 32 bit with 4 Mbyte RAM should
be enough for most people.

>confused by the fVDI site. I also haven't found anywhere that lists
>the refresh rates possible, which maybe explains why I was getting
>inconsistent results.

As I said, fVDI is supposed to 'intelligently' drop down to something
that _is_ available, but apparently that doesn't work as it ought to.

If you're actually using the fVDI and RageII driver from last summer,
things might well have changed now too (can't recall).
Actually, downloading v0.95 might well cure some of your other
problems too.

I do the same with my screeneye, works perfectly long time.
Any solder point should be stable and clean.

Otherways you have to build your own adaptor for the slots on CT2A. Bad
point of any selfmade bus connector are the long wires of any track from
the CPU Bus.

With an accellerator keep Bus wires short as can.
Best tip what i can gave..

6942. Re: I search a mouse for atari 1040 ste

Newsgroup: comp.sys.atari.st
Date: 2000-06-11 00:00:00 UTC
From: Me <woodprimer@nospamlineone.net>
Message-ID: <8i10e9qqb1@supernews.com>
Source record: 61038

you can use a pc mouse
3.5 Mouse and Keyboard

3.5.1 Mice, mouse, meece

The Atari mouse was quite poor, and very few remain in good working condition after the years. When it finally needs replacing, these mice are very hard to find. Try contacting an Atari dealer in your area, as most of them carry some sort of Atari compatible mouse.

A PC serial mouse can be connected directly to the serial (modem) port. There are two drawbacks to this. Firstly, on a machine with only one serial port it prevents from connecting anything else (modem, extra midi ports...). Secondly, you will need to load a serial mouse driver such as Genmouse, which can be found on your favourite FTP sites (see section 2.2.3). The problem is that, being an auto folder program, it will obviously not run with autobooting programs such as games.

Genmouse
http://ftp.lip6.fr/pub/atari/Utilities/gmouse25.zip
ftp://ftp.leo.org/pub/comp/os/atari/drivers/mouse25.lzh

A PC mouse can be attached to the Atari mouse connector, but this needs a complicated adapter board, such as those described here:

DIY PC to Atari mouse adapter
http://members.aol.com/tgkirk/pcstmous.htm

Mario Becroft's Atari/PC keyboard and mouse adapter
http://planet.ak.planet.gen.nz/~mario/hardware/mouse.html

Some Amiga mice have a little Amiga/ST switch allowing them to be used on an Atari, the only difference between the two being two swapped wires.

Converting an Amiga mouse to an Atari mouse
http://bales.online.fr/atari/files/text/amimouse.txt

Although old PC Bus mice are now probably as difficult to get as ST mice, instructions on adapting one for use on an Atari can be found here:

http://bales.online.fr/atari/files/text/pc_mouse.txt

If all else fails, you can always use the Alt + Arrow keys trick (Alt + Shift + Arrow keys for pixel scale movement, Alt+Clr/Home for left click, and Alt+Insert for right click) as a lifesaver, but that's hardly a practical solution in the long run.

Erratic mouse behaviour is sometimes caused by a faulty connector. The mouse port connections under the keyboard, are subject to stress when there is continuous plugging and unplugging of the mouse (to connect a joystick for example). A remedy for this is to take apart the ST and touch the solder joints that connect the mouse connector to the keyboard PCB with a soldering iron, just to restablish a good contact by slightly melting the solder.

you can use a pc mouse
3.5 Mouse and Keyboard

3.5.1 Mice, mouse, meece

The Atari mouse was quite poor, and very few remain in good working condition after the years. When it finally needs replacing, these mice are very hard to find. Try contacting an Atari dealer in your area, as most of them carry some sort of Atari compatible mouse.

A PC serial mouse can be connected directly to the serial (modem) port. There are two drawbacks to this. Firstly, on a machine with only one serial port it prevents from connecting anything else (modem, extra midi ports...). Secondly, you will need to load a serial mouse driver such as Genmouse, which can be found on your favourite FTP sites (see section 2.2.3). The problem is that, being an auto folder program, it will obviously not run with autobooting programs such as games.

Genmouse
http://ftp.lip6.fr/pub/atari/Utilities/gmouse25.zip
ftp://ftp.leo.org/pub/comp/os/atari/drivers/mouse25.lzh

A PC mouse can be attached to the Atari mouse connector, but this needs a complicated adapter board, such as those described here:

DIY PC to Atari mouse adapter
http://members.aol.com/tgkirk/pcstmous.htm

Mario Becroft's Atari/PC keyboard and mouse adapter
http://planet.ak.planet.gen.nz/~mario/hardware/mouse.html

Some Amiga mice have a little Amiga/ST switch allowing them to be used on an Atari, the only difference between the two being two swapped wires.

Converting an Amiga mouse to an Atari mouse
http://bales.online.fr/atari/files/text/amimouse.txt

Although old PC Bus mice are now probably as difficult to get as ST mice, instructions on adapting one for use on an Atari can be found here:

http://bales.online.fr/atari/files/text/pc_mouse.txt

If all else fails, you can always use the Alt + Arrow keys trick (Alt + Shift + Arrow keys for pixel scale movement, Alt+Clr/Home for left click, and Alt+Insert for right click) as a lifesaver, but that's hardly a practical solution in the long run.

Erratic mouse behaviour is sometimes caused by a faulty connector. The mouse port connections under the keyboard, are subject to stress when there is continuous plugging and unplugging of the mouse (to connect a joystick for example). Hello everyone,

I just got a HP Laserjet 4P and want to have it work with 1St Word 3.2.
Does anyone have an appropiate printer driver HP.CFG or a Hex-File
HP.HEX?

Thank you in advance,
Martin

>
>If I can get my IDE disk working, I'll most likely fix this tonight.

This has now been fixed and you can find new FVDI.PRG and RAGE.SYS files
in the /pub/fVDI/Beta directory on my ftp site (go there via my WWW
pages to avoid problems (Netscape and IE, among other programs, can't
access the machine directly using ftp (supposedly due to some kind of
firewall setting regarding 'passive mode' ftp)).

The screen size is now set up in FVDI.SYS using 'width' and 'height':
width 280 # screen image with in mm
height 220 # height

The Rage driver itself will use these values to calculate the pixel
size after the resolution has been decided.

6948. Microsoft's Being Forced To Split

Newsgroup: comp.sys.atari.st
Date: 2000-06-12 00:00:00 UTC
From: Terry May <outrider@lvcm.com>
Message-ID: <dbcaks8tbpjjjtg63612gasr6mrs0jg7mk@4ax.com>
Source record: 60950

I came across this today. It's sort of on topic, since it mentions STiK/CAB. I thought that was pretty cool:

1. On Microsoft's Being Forced To Split:

Wow, what an awesome day for computing! Thanks, Judge Jackson!

Just think, in today's horribly noncompetitive, Microsoft-dominated environment, we have no real browser choices at all, except for AwebII, Amaya, Arachne, Cello, Chimera, Grail, HotJava, I-Com, I-View, IBrowse, InterGo, Internet Workhorse, Lynx, Mosaic/MultiLingual Mosaic, NeoPlanet, NetCruiser, Netscape, Mozilla, OmniWeb, Opera, Quarterdeck, Spyglass, STiK/CAB, Sesame Navigator, SlipKnot, Softerm, Tango, Tiber, TkWWW, UdiWWW, Voyager, WebExplorer, WebTV, iCAB, Microsoft's Internet Explorer and a few others; or about 100 different ones in all if you count various subtypes and versions. Thank you, Judge Jackson, from rescuing us from this lack of choice!

Likewise, in today's horribly noncompetitive, Microsoft-dominated operating system environment, we are totally *straightjacketed* into running only BeOS or FreeBSD or FreeDOS or Solaris or OS/2 or the MacOS or the AmigaOS or any of the many classic *NIXen or any of the approximate 50(!) flavors of Linux--- or one of the 5 flavors of Windows in wide circulation. I can't wait until we actually have some choices!

Clearly, Microsoft's stranglehold on the industry has completely stifled development of all alternative approaches and kept prices artificially high, which is why computers remain exotic and rare luxury purchases in the hands of only tiny numbers of the super-rich and the technologically elite.

Thanks to Judge Jackson's vision and courage, maybe one day we'll reach the goal of having computers for the masses, in every business and many homes; with hardware and software so cheap some companies--- ISPs, for example--- will even be able to give away complete computer systems for free, just for signing up! And we'll finally have a choice among dozens of browsers and dozens of operating systems, many of which won't cost a dime. Clearly, this happy day of cheap, ubiquitous hardware and abundant, affordable software never would happen without Judge Jackson's brave actions.

Er, waitaminit---it already happened? Long *before* Jackson's ruling?

Um, Judge, can we talk?

>I didn't say that switch-mode PSUs are low-tech. I said that chopper
>transistors, oscillator/driver chips and opto-couplers are hardly 1999
>developments, a statement with which I think that you'd have to agree.

Thats not what i read, but specificaly you stated that chopper PSU's are made with over stressed devices, thats not true and its also total crap.

>I also said that they haven't improved much during the 90s, with which
>you may not agree,

I cannot agree, coz thats total shitte, they have advanded greatly, you can now have almost a complete switch mode PSU in an 8 pin chip.

>but you can't change Ohm's law. You still need a certain cross-section of copper or
>silicon to carry a given current without over-heating.

You cant change Ohms law, but you can increase the current through a device and reduce dissipation with carefull design. Look at the size of an FET in a modern PSU, and then note the heatsink size, about 2 inch square??, now note how the transformer is about 3 cubic inches in size, and everything is still running at room temperature hardly over stressed.

>And this 75 watt tv power supply.

Thats 75W drawn from the mains supply!

>What's its efficiency? Let's be very generous and say 80%.

Er no, they are mostly reclaim designs, so lets argue that its more about 500% efficient in their reclaim phase.

>It still has a lower ouput than the MSTe/TT PSU, so I should hope that it is smaller.

Thats total shitte!!, a TT psu could not drive a Audio amplifier to the specs i stated, let alone a Line timebase for a wide screen TV as well.

Have a look into some PSU designs then come back and argue when you have some facts.

I have found out that from Holland (nextdoor to Belgium) the
connection sometimes is OK with 3k/4.5k b/s download but sometimes
from the start of the conenction I only get 300 cps and that stays.
When I try immediately the connection (tel) through another
provider also 300 cps.
But then I wait for half an hour and ... back to normal 4,5 kb/s
Seems that te server is very busy sometimes and allowes you not more
bandwith than 300 cps, someting he does not seem to upgrade ypou
connection once the bout of activity has diminished.
Or am i fantasising now?

Hi John and others

You don't even have to rename them, just load the *.exe file in ST-Zip
and it depacks fine.

Oh, this mail gives me the impression that you are the (?) or one
of the developers of that graphic card(s) with fVDI?

Sorry for not knowing, but it seems that at minimum to me - or
even more in Germany - that cards aren't known very well?

Or maybe I have slept for too long, which also can be? X-)

But to help both of us, you and us, I would love to serve you
with an English Papyrus copy, so that we both could look it up (for
free, of course). (I'm one of the developers of Papyrus).

If this could help? :-)

Yup, It's amazing how this Microsoft lovers suddenly remember
that there are other computing plataforms (even ataris!) when is
convenient, but when their favorite company change
the "standards" using their power and unlawful methods to
consolidate the monopoly, they couldn't care less ;).

Hallo Terence!

TK>Swiss 721 is on my system. It shows up in the Papyrus font selector.
TK>I can use it to write a document, but your help files do not recognize
TK>it is there.

Workaround: Rename PAPYRUS.INF to xPAPYRUS.INF (Papyrus would find PAPYRUS.INx
:-), load PAP_HELP.PAP and all those documents that are normally opened at the
first launch of the demo, and save them again. Then the correct charset is
there (in _formate.glo). You may then delete the newly appeared papyrus.inf and
restore the old one.

Ulli, I hope this wasn't too wrong ;-)
At least it worked for me on both my Falcon and my Milan 040 with the german
8.20 demo.

>
>You should be able to do footnotes with either numbers,
letters, or
>characters.
Unfortunately true for scholarly work. Each journal has its own
requirements regarding letters or numbers, endnotes or
footnotes. In fact, I do my professional writing on WP 4.1 for
the ST because of its wonderful footnoting.

>My reference to roman numerals should have been with
pagination. Many
>scholarly documents require that you paginate with roman
numerals for
>certain sections of the document.
Huh? I've only seen this for the introduction of a book.
Perhaps you need it, but I never have.

>Endnotes are often required when submitting an article for
publication.
>Please note that the options I've listed for footnotes,
pagination, and
>endnotes are not MY requirements. They are standard
requirements found in

them, you
>simply cannot. Universities are where many students settle on
the programs
>they are going to use for a long time.
I think this is good advice. I rarely write for publication
anymore, but it sounds as if Papyrus is not suitable for
academic writing in its present form. Although the academic
market is a pretty small sector, most college students will have
to deal with academic styles at one time or another.

>else feel the same, so I'm not the voice crying in the
wilderness?
I'm personally very fond of the thesaurus in Atari Works, and I think that a "spell checker" and a "thesaurus" are rather expected features of a modern word processor. However, since no useful grammar checker exists, there is no point including one.

If you are interested in developing something new and different, I'd like to see a "dictionary" that not only made suggestions for typos, but gave the definitions of the replacements. If the user selected a single, correctly spelled word, the "dictionary" would provide synonyms instead.

I just don't ask for the version of SpeedoGDOS - NVDI always is the
better choice, from our viewpoint and taken the experience from all our
customers. NVDI is a living product, and much more stable.

> > > > >lists it in the fontbox and lets me choose it from there.

My fault, I guess. The big prob is, that there is no real standard font.
So I thought the most common "Swiss 721" is the best choice (instead of
using pixel fonts), but I did it on my machine with the TRUE TYPE
Swiss 721 BT, not with the SPD (Speedo) version.

So load the most important docs, specially TEMPLATE/_NEW.PAP (the
template
for every new document) and HELP/PAP_HELP.PAP and save them after having
changed my Swiss 721 BT (True Type) to your Swiss 721 (Speedo).

I will do, as well, in the next version.

Now it is how it is meant to be, in correspondence with the Behne
brothers
and there NVDI 5.

> The compatibility dialog already contains an option for 93
> dpi. Since this has no effect on my display, I'm assuming that Papyrus
> thinks my display is 93 dpi. The Atari screen has always been represented
> as 90 dpi or 91 dpi in all documentation.

Also in agreement with the Behnes, sorry ... NVDI is the system tool,
we
only follow what they set as standard.
>
> You should be able to do footnotes with either numbers, letters, or
> characters.

Should we ... That important? Nice, maybe, but we try not to put that
much feature variants into Papyrus than MS does in MS Word.

> My reference to roman numerals should have been with pagination. Many
> scholarly documents require that you paginate with roman numerals for
> certain sections of the document.

I see ... So it is kind of an English standard, then?
>
> Why not allow Papyrus to fit in with
> a few simple adjustments?

;-) True from that ONE viewpoint, but there are dozends, if not hundreds
of "tiny" features that some people want.
And we have to "filter" which one really are important - and which
aren't.

Again, by philosophy (!) we try not to become such a heavy rock as MS
Word is.

> A thesaurus is a standard writer's tool, and is especially valuable in a
> large project. After you read over a chapter and find that you've used the
> same expression far too many times, it's sure nice to have one.

Yes, maybe. But if we would put in too much of stuff like that, we would
hang of 4 MB machines for sure ...
And I can live without, even in the more complicated German language.
And
if I really want to find a synonym, I can use a printed dictionary.

But OK, itï¿½s a nice "should have". Not a "must have" ;-)

> I'm not really a good judge of whether a database is best or not. I rarely
> need one for any serious work. I am used to being able to edit a database
> in the list view. I couldn't do that with the demo.

Try something in the 8.20 - try to use the HyperOFFICE links. They give
you
something you won't find in other wordprocessors - the possibility of
putting
in cites for a literature list as easy as it could be.
The cite is marked as a HyperOFFICE link, something like a normal
Hypertext
link, but not to another text passage, but to a database record.

I wished I would have had this for my diploma work with hundreds of
literature cites in it, years ago ...

> I also noticed that there is a problem with the submenus. On my 640 by 480
> TT medium display, the summenus in the file and edit menu display over the

That was Rodolphe's suggestion to me when I wanted to know if it would be
possible to combine my CT2B with a Nova card.

Looking at the Eclipse bus adaptor, does it look possible to fit a through
port to it, the picture on Titan/Coretex/whatever's web page is way too poor
to make this sort of detail out. How much clearance is needed for the
connectors/ribbon cables?

If Superbase has a driver for Epson printers you might be able to use the
Laserbrain Epson emulator to drive your Atari laser. Drawback is that it's
only a 9 pin emulation IIRC. That emulator should be available from the usual
Atari ftp sites.

>to hook up an Atari laser to a pc? Failing both, I have a perfectly good

This is possible, you'll need to keep the Mega as a server for the laser
printer tho'. You'll find the program you need on my web site, follow the
"Translated apps" link (although it's actually still in German).

>>card. After installing the Eclipse I now have a spare Nova that I want to

> How do you rate the two cards, leaving aside the loss of STRAM above 4Mb with
> the Nova?

Hardware-wise the Eclipse is superior. Since my Nova is "just" a 1Mb DRAM card, it's a lot slower than the Eclipse. Also, with the Eclipse I can use 1280x1024 in 16-bit colour at 75Hz, something the old Nova-card couldn't.

The Eclipse is also quite a lot faster in 1280x1024x16@75 than the Nova in 1024x768x8@60, and the driver doesn't suffer from the initialization-problems that sometimes forced me to power-cycle the Falcon to get anything else than a black screen.

fVDI is also a bit more clever than Nova-VDI, and it has a few tricks upp it's sleeve that increase speed even more (like moving the AES background-buffer to the graphics-card instead of ST-RAM). But it's also a lot less compatible than Nova VDI, e.g. currently it completely refuses to work with MiNT on my Falcon/AB. I also have serious problems under MagiC, so until Johan can fix the MiNT-problems I really can't use it.

> Looking at the Nova bus adaptor, does it look like it would be possible to
> fit a bus extension to it for a CT2B, and how much clearance is needed for
> the Nova's ribbon cables?

This should be fairly easy to do, you need about 20mm clearance but that's all. I'm more concerned about the CT2, it lives on the edge already and I suspect that adding a Nova will create a lot of problems. I haven't heard of anyone who has managed to get this working yet.

I do. A monopoly in legal terms doesn't mean 100% control. It just means being big enough to dominate the way the market works. Rockefeller didn't control the oil market but his company got broken up, likewise AT&T.
In the UK British Telecom was never a monopoly under your interpretation of the term, but you'd have had difficulty in getting connected through the Hull telephone company.

Say hi to the rest of the Micro-serfs/shareholders.

There were hp_djet.cfg and hp_laser.cfg files on the V3.20 maintenance
release. I can send these to you - they are quite small. I have also
made a more extended hp_dj520.cfg (and .hex) with some extra features,
which will probably work on your 4P - or at least serve as a templaate
to make your own adaptation.

It was not officially released yet, what he was referring to was its
appearance at the World of Alternatives show that took place the 10th and
11th of June. There was a Milan II prototype shown, along with two design
studies of the possible cases/configs.
The Developer machines are said to be shipping in 6 weeks.
There are pictures of the Fair on the Milan webpage, various amiga sites
(such as amiga-news.de) and reports can be read on the Place2be and MagiC
Online.

Yep - it wasn't Microsoft who restriced GEM to 4 windows and no trash can -
that would be Apple...

Look at it this way - Apple develops Macs, UMAX wanted to develop Macs too,
Apple bullys UMAX into closing up shop. Would you say this is an acceptable
tactic? And what about Mac OS :)

And Micro$oft open-source Windows, should everybody else do the same?

> >There are so many other PC compatiable OS's out there at the

> this is after all an Atari NG).

Rubbish - Linux has been out there for ages, definately since before this DOJ business, I don't have a problem with Linux - but as an adverage user (out of the box business) would you really want to have to piss about with getting Linux to work with your hardware - and then worry about having to rebuild you PC if you don't shut down properly? Again - there's nothing wrong with BeOS either, but its all about compatiablity and regretably Microsoft have cornered that.

Atari emulators are great if you want to run Atari software on a PC - but that doesn't really help the matter (i'd much rather have a real ST).

Don't get me wrong - I would love to see Linux end up the OS of choice on the PC, but from an User's perspective - its not going to happen soon, regardless of weather MS is broken up or not :)

Matt.

>printed output is no longer truncated.

Actually, I'm not so sure they do, though it should be better.
I discovered a bug in my patch an hour ago and have now uploaded yet
another set of files to the same place.

With this new version you can also give a negative value for the
width/height, which will then be interpreted as a DPI figure for
the pixels.

Unfortunately, the wide line code can currently get confused if the
pixels aren't square. I'll fix that in the reasonably near future.

By the way, the new code also 'fixes' the 800x600 problem, by
reporting that resolution as 800x592. This means that the bottom
eight pixels won't be used by any program (and that they, for the time
being, will contain random garbage).

>I'm running in 1024x768, 16-bit colour, 75Hz refresh, and it all

Ah, sorry. In the case of the desktop, the culprit would be the AES
background buffer caching. To disable that you need to remove the ACC.

>>>2) The 'onlysrc' option fixeds the no-icon display on the desktop, but
>>>they display with a fixed white background regardless of the colour of
>>

>>I know. There's little else that can be done, unfortunately.

>
>I'll play around with that and document the results for you.

Thanks.

I've not been able to reproduce any of the 800x600x32@80, etc, problems,
by the way. I always get the correct resolution and colour depth, but
with a lower frequency if no exact match is found.
If you still have problems with that, please send me the corresponding
FVDI.SYS.

>Thanks for your help on this Johan - I'm now even prouder of my

Thanks for putting that one together. My first thoughts after reading this:
- 1500 DM isn't expensive at all, but probably much more than the cost to manufacture the Milan II.
- The cases look ugly to me. I hope they don't need moving parts (fans for coolers).
- 30-40 seconds to boot? I do hope that was a mistake. Otherwise, that'd be very, very bad...

I think if Best or whatever, really want to help Atari users, they
would simply publish the maker/model of the PSU they found that
fits in the TT metal case. And have an option to sell some
intructions for a few dollars, for the novice out there.
Let's us buy the product at the same price the peecee user
would pay. I think that would be fair, as apposed to inflated
prices.

It has been a while since he's appeared on IRC, I cannot recall
the last time he did. When he did appear he didn't say much sometimes
but now I don't see him popping in at all.

I'm ok, time does tend to heal wounds or at least takes the edge off.
Perhaps a few after effects you can't seem to shake, maybe it's just me.
Anyway I hope his absence is just simply him taking some time to
regather himself. Such things can really throw a dent in your
normal everyday routine.

That would probably be me whow mentioned yanking the HD. ;-)

Silly question, but won't adding another fan put more load on
my already "on the edge" PSU? Bear in mind I don't know the
power requirements of a fan per say.

Thanks, Lonny.. I don't supposed you've hopped on IRC with him recently?

Barry and I have also traded some stuff--he bought a Cubase Audio Clock, SF314, MSTE keyboard and some monitor cables from me... anyone else care to share a Barry story? :^)

Maybe it'd just be best to wish him well wherever he is (and you as well, Lonny)...

Cheers,
Derek

> > > > >doesn't recognize that Swiss 721 is available on my system, even though
> it
> > > > >lists it in the fontbox and lets me choose it from there.

My fault, I guess. The big prob is, that there is no real standard font.
So I thought the most common "Swiss 721" is the best choice (instead of
using pixel fonts), but I did it on my machine with the TRUE TYPE
Swiss 721 BT, not with the SPD (Speedo) version.

So load the most important docs, specially TEMPLATE/_NEW.PAP (the
template
for every new document) and HELP/PAP_HELP.PAP and save them after having
changed my Swiss 721 BT (True Type) to your Swiss 721 (Speedo).

I will do, as well, in the next version.

> I don't consider the scaling as set in the demo as a plus. NVDI/Speedo
> provides fonts across the entire system. A 12 point font in one program

> In the past this was always true of Papyrus; now it is not.

Now it is how it is meant to be, in correspondence with the Behne
brothers
and there NVDI 5.

> The compatibility dialog already contains an option for 93
> dpi. Since this has no effect on my display, I'm assuming that Papyrus
> thinks my display is 93 dpi. The Atari screen has always been represented

Also in agreement with the Behnes, sorry ... NVDI is the system tool,
we
only follow what they set as standard.
>
> You should be able to do footnotes with either numbers, letters, or
> characters.

Should we ... That important? Nice, maybe, but we try not to put that
much feature variants into Papyrus than MS does in MS Word.

> My reference to roman numerals should have been with pagination. Many
> scholarly documents require that you paginate with roman numerals for
> certain sections of the document.

I see ... So it is kind of an English standard, then?
>
> Why not allow Papyrus to fit in with
> a few simple adjustments?

;-) True from that ONE viewpoint, but there are dozends, if not hundreds
of "tiny" features that some people want.
And we have to "filter" which one really are important - and which
aren't.

Again, by philosophy (!) we try not to become such a heavy rock as MS
Word is.

> A thesaurus is a standard writer's tool, and is especially valuable in a
> large project. After you read over a chapter and find that you've used the
> same expression far too many times, it's sure nice to have one.

Yes, maybe. But if we would put in too much of stuff like that, we would
hang of 4 MB machines for sure ...
And I can live without, even in the more complicated German language.
And
if I really want to find a synonym, I can use a printed dictionary.

But OK, itï¿½s a nice "should have". Not a "must have" ;-)

> I'm not really a good judge of whether a database is best or not. I rarely
> need one for any serious work. I am used to being able to edit a database
> in the list view. I couldn't do that with the demo.

Try something in the 8.20 - try to use the HyperOFFICE links. They give
you
something you won't find in other wordprocessors - the possibility of
putting
in cites for a literature list as easy as it could be.
The cite is marked as a HyperOFFICE link, something like a normal
Hypertext
link, but not to another text passage, but to a database record.

I wished I would have had this for my diploma work with hundreds of
literature cites in it, years ago ...

> I also noticed that there is a problem with the submenus. On my 640 by 480

On what I've seen of UNIX & C when they were invented, compared to what I was using
at the time.

> HR> When Bill and K&R were little boys...
>
> Bill didn't write PC-DOS, or CP/M.
>

Bill never invented anything.
As far as I know he bought a CP/M like OS cheap, turned it into MS_DOS
and carefully forgot to tell IBM that it was for sale. :-)

In the early 80's the state of the art in operating systems was quite high.
But all these operating systems ran on big mega$ mainframes.

The desktop computer manufactors basically had to go back in time, because
their early machines couldnt possibly run any of the, at the time, modern
operating systems. They had to start nearly from scratch again.

Unfortunately very little of those mainframe systems have survived, cause by
the time they could have been ported to a PC, every PC already ran Windows.

Effectively Bill, Jack & Steve have put the state of the art in operating systems
permanently back some 25 years. But they didnt do that on their own. They were
helped by the companies that thought they could save money.

Unix was definately *not* the most sophysticated OS of its time.
(It is already quite old you know)
It's multitasking kernel may be good. But that is not nearly enough.

Windows is by far the worst ever, considering it's claims

So the worst OS is dominating now, and the worst but one has survived the transition
from mainframe to desktop.

Sad.

Source record: 60973

Don't get me wrong here - I'm certainly no Micro$oft lover but if you look beyond the fact that "yes, they have a strong grip on the *PC* market" and then look at what they've achieved - to be honest i'm not sure if I would have wanted to be using a very restriced GEM and DR-Dos instead of MS-Dos and Windows 3.X, not to mention IMHO Netscape's browser sucks compaired to IE (I'm expecting alot of flack about this :).

Then if you look at the other software they produce - Visual BASIC, C (ETC), Office..... Have they really done all that bad of a job?? Everybody complains about how buggy they're software is but have things changed so much since TOS 1.02 - that was buggy as hell :)

I completely agree with the fact that Micro$oft should be more open about its dealing but i'm sure breaking it up isn't the way forward, not to mention they would just get back together in 10 years anyway.

As for driving software prices down, why would it do that? Is the other half on Micro$oft going to be making and OS - I doubt it, and thats where most of the price is. There are so many other PC compatiable OS's out there at the moment - the problem is (from a user view) that they're all so un-friendly, take any variation of Linux for example. To the adverage user it would seem like a step back - going back to a CLI enviroment (and yes I know about X-Windows and KDE). People want simplicity and functionality - Windows provides that.

Matt.

I've never used a NOVA card, but I'd guess a significant part of the
speed increase comes from the better use of the mach64 hardware
acceleration engine.

You really ought to try a vector drawing program like ArtWorx or
Kandinsky. ;-)
The included VDIBench program is also worth checking out to see some
really fast drawing.

>background-buffer to the graphics-card instead of ST-RAM). But it's also a
>lot less compatible than Nova VDI, e.g. currently it completely refuses to
>work with MiNT on my Falcon/AB. I also have serious problems under MagiC,
>so until Johan can fix the MiNT-problems I really can't use it.

I tested a few different configurations on my AB040 machine last night and
while I can definitely run fVDI together with MiNT (1.15.9b with memory
protection on) using the normal AES/desktop as well as N.AES (1.1)/Thing,
or for that matter MagiC (5.1), there does seem to be problems if NVDI is
to be used at the same time.

The problems might have something to do with the fact that NVDI wants to
run before MiNT and fVDI preferably after. Also, there might be some kind
of 'vector bending clash' between fVDI and NVDI that gets worse with the
addition of MiNT/MagiC.
I'm going to experiment a bit with delayed memory allocation (so that
fVDI doesn't end up with some buffers allocated by the old TOS and some
by MiNT) and less vector bending.
There really is no inherent reason why fVDI should have more problems
than the NOVA VDI with these configurations.

Sorry, you won't hear me cry for microsoft. While there may be quite a
few choices out there, the business actions alone would prompt the well overdue
legal action that is currently being taken against Microsoft.

First off, check out the story of CP/M sometime, and many other businesses
that Microsoft ran into the ground through bullying and bad business practices.

My words are "about time".

BuyItSellIt.com, a newly launched auction, classified ad and want ad site, has made all of it's ads free through June 30.

To attract both buyers and sellers, we have made our services free of charge for the month of June. Users pay no commission, posting fees or other charges for auctions, classified ads and want ads. You can even include multiple images, HTML and longer text information for no extra charges.

BuyItSellIt also offers services that other auction sites have overlooked. Our main feature is our system of user grouping called our "neighborhoods."

In the signup process, we group our users into communities according to their interests. These people can then interact with others in their neighborhoods using our message boards. Users can ask questions, provide expertise or simply chat about their lives.

We think that this interaction will lead to a site where users know each other better than other sites. You're not dealing with a stranger, but a known community member.

We also offer FREE intermember messaging (to protect anonymity), FREE hit counters on auctions, and FREE featured status for ads that receive heavy traffic.

Please visit http://www.buyitsellit.com, sign up for a FREE membership and post some auctions. We want to create a new type of online auction site with your help and input. Any suggestions, advice or other information you can provide would also be greatly appreciated.

Chris Burgess
BuyItSellIt Marketing/ Customer Relations

Hi!

Official Milan web page.
www.milan-computer.de/gb/index.html

Very good with lots of information. Updated regulary (I mean
sometimes once a week!)

Magic Online
bengy.atari-computer.de/m_milanii.htm (might be magicos.de) now)
Excellent report.

Buying a Mialn in Germany should be quite easy, there seems to be
quite a few big chains selling them. In the UK I'm expecting System
Solutions to sell them.

When they'll be for sale I'm not sure. Next month maybe?
By looking at the spec's and the new software together with a great
software bundle, will hopefully make it sell quite well.

That's true.
I'll do it the other way around instead and report the screen as 800x592.

>
>Never heard of it ... Who's the producer?

As you've probably realised by now, the problem appears to have been with fVDI, which is a VDI replacement needed for driving the Rage graphics card, supplied with the new PCI interface card from Cortex.

It appears Papyrus Office has been 'fixed' to work as it should do with regard to font size, but this showed up a limitation with fVDI. That has now been solved, and I must say how pleased I am with the whole setup now!

Thank you very much for continuing to suppoer the Atari platform and for developing quality applications such as Papyrus Office - we need you! I just hope you get the custom you need to carry on going.

Out of interest, how are sales doing with the other platforms?

By the way, I'm the one who requested the Papyrus files to be sent again as my hard drive went funny - see my plea for help in comp.sys.atari.st.tech!

Hello again,

I've downloaded the latest FVDI.PRG and RAGE.SYS from your beta
directory, and...

yes, yes, YES!

(excuse me while I have an orgasm)

CAB and Papyrus Office now both display fonts properly on screen and
printed output is no longer truncated.

I'm running in 1024x768, 16-bit colour, 75Hz refresh, and it all
looks...beautiful!

>>1) Pop-up sub-menus in Papyrus Office and CAB 2.7 don't repaint
>>properly, leaving a black or multi-coloured 'hole'.
>
>Could be a 'screencache' problem. Try disabling that.
>Also, try with and without 'doblit' (I seem to recall changing the
>definition of that at some point).

This problem appears to be improved too. The sub-menus no longer
scramble the background, but just leave a thin vertical line or two,
which is not perfect but it's OK. The desktop dialogs still have the
saem problem though. I've tried removing screencache and with/without
doblit, but no effect.

>>2) The 'onlysrc' option fixeds the no-icon display on the desktop, but
>>they display with a fixed white background regardless of the colour of
>
>I know. There's little else that can be done, unfortunately.

OK, no worries - 16-bit colour is good enough for me!

>>5) DEFAULTS doesn't appear to work properly - I once set a mode to be
>>640x480x16 and got 1280x1024! I'm setting the mode explicitly in the
>
>Could you, please, send me a letter describing what you did and what
>DEFAULTS reported?

I'll play around with that and document the results for you.

Thanks for your help on this Johan - I'm now even prouder of my
Falcon!

Chris.

Yup - don't worry, it was only a method of isolating the problems!
It's NVDI I really want, not SpeedoGDOS.

>Which version of NVDI did you try? The newest 5.x?

5.02 I think.

Just tkrom4f.prg, pcibios.prg, mintnp.prg (1.15.9, and all other versions
I've tried) and fvdi.prg (in that order) doesn't work, fVDI crash with a
bus-error when loaded after MiNT. If it's loaded before, the program that
opens the physical workstation crash with a bus-error.

I suggest that you send me the binaries (tkrom4f, pcibios, fvdi) you're
using so I can try those, it's most likely a version-conflict or the
configuration of the AB-driver.

> or for that matter MagiC (5.1), there does seem to be problems if NVDI is
> to be used at the same time.

With MagiC I only get a lot of mess on the Eclipse, but I also recall that
I had a similar problem under TOS which I ofcourse has forgotten how I
solved ;-)

NVDI doesn't make a difference here.

Just discovered that moving an otherwise fixed dialog using Let'em Fly
also scrambles the background. Presumably this is the same as the
Dektop dialog problem.

>have wanted to be using a very restriced GEM and DR-Dos instead of MS-Dos
>and Windows 3.X, not to mention IMHO Netscape's browser sucks compaired to
>IE (I'm expecting alot of flack about this :).

The point is, would GEM/DR-DOS on a peecee (well, GEM had copyright issues,
I guess. DR-DOS certainly, maybe a GUI like GEOS) have remained primitive
if Microslop hadn't barred them from the market through sleazy tactics?
If Netscape is on the loosing end of the browser wars, is it because they
are incapable of innovating, or because they have been excluded from the
market long enough to loose momentum?

>Then if you look at the other software they produce - Visual BASIC, C (ETC),
>Office..... Have they really done all that bad of a job??

The point is, could anybody else have done better? Don't talk to me about
Visual C; Borland C was better in every way than anything Microslurp put
out, but they were forced out of the market by dirty tactics by the
owner of the OS.

>I completely agree with the fact that Micro$oft should be more open about
>its dealing but i'm sure breaking it up isn't the way forward, not to
>mention they would just get back together in 10 years anyway.

Breaking them up is the ONLY way to let ANYONE ELSE move forward... and a
lot of opinion casts doubt on the success of even THIS remedy.

As far as opennness goes, I don't that much hate Windows itself all that
much, just the fact that it is essentially the only option, one company
owns it, and they got to that point by power, not technical superiority.
For an engineer, this is unacceptable. Openness? Open-source Windows!

>There are so many other PC compatiable OS's out there at the
>moment - the problem is (from a user view) that they're all so un-friendly,
>take any variation of Linux for example. To the adverage user it would seem
>like a step back - going back to a CLI enviroment (and yes I know about
>X-Windows and KDE). People want simplicity and functionality - Windows
>provides that.

The only reason ANY other peecee OS is out there at the moment is because
Microstomp has been distracted by the DOJ business. Don't like Linux/X?
Get BeOS. Get an Atari emulator or a Milan/Hades/etc. (I had to say that;
this is after all an Atari NG).

Hello Uli,
you said, (among many other things)

On 13 Jun 2000 00:20:41 , Ulli Ramps wrote:
[...]
>No problem, it's the OTHER way round: We SEARCH for critics. Best way to
>get better.
>
O>K. here is feedback:

I found no problems with RTF format between Papyrus Atari, P.Windows
and Word. But did not check if all characters in European use stay ok
like the Spanish ? upside down.

Next I found out that the demo Windows P makes UTF-8 and indeed there
are W-programs like Unicode PovRay raytracer that are able to use
strange characters.
But I could not find UTF-8 in the Atarai version. Is it there
somewhere?

Furthermore: now that W-Word exports Unicode, how about Papayrus?

And I have a problem with placing characters on the keyboard.
In Windows I switch 'land-specific' but only within the group of west-
european languages mostly.
Do you have a help-file to explain how to take your pick from your
Unicode font (13Mb) and connect them to the keys on Atari?

In concreto: I have to type a German text (umlauts) that contains
dutch (liguture i-j) and french (with the special french quotation
marks) with small pieces of Pali text (mostly in the footnotes, but
also in the index!!!(((wow, how to sort??))))).

And do no tell me to pick those special characters one by one from a
Unicode font-table that is what i have to do with Windows but Atari
can do this better isn't it?.

keep up the good works and think about the problems we multilingual
typing people have with computers. {-:)

Met vriendelijke groet,
Ronald van der Kamp

I was a bit too fast here, CAB displays all pictures as solid, light gray
blocks in 8 bit, and BubbleGEM-bubbles are white and not yellow as they're
supposed to be.

The last issue of Yackity-YAC was October-November 1998. The
club continued to meet until July 1999 when I moved to the Los
Angeles area. Several members (including the founder, Eric
Hays, and the well know 8-bitter Bill Kendrick) are now highly
active in the Linux User Group of Davis and have essentially
stopped using Ataris on a daily basis. I have YAC's library,
disk library, and the remains of the treasury, which I brought
(with permission) to LA in the hope of starting up YAC in S.
Cal.. Unfortunately, the few LA Atarians I've spoken to do not
seem interested.

So in a nutshell, YAC is now a few boxes of stuff, a couple of
hundred dollars, and one fanactical Atarian. Me.

At least fVDI is still under development, so with Johan's help I'm sure that
this can be sorted. I guess you didn't have any problems with the Nova
installation (aside from the animated GIFs one from an earlier thread).

>> Looking at the Nova bus adaptor, does it look like it would be possible to
>> fit a bus extension to it for a CT2B, and how much clearance is needed for
>This should be fairly easy to do, you need about 20mm clearance but that's

That's still quite a lot - I can't think of an easy way to implement this ATM.

>all. I'm more concerned about the CT2, it lives on the edge already and I

I agree. I previously owned Calligrapher which had a grammar checker, I very quickly turned it off because of its constant querying of stuff that I already knew was 100% correct.

Anyone with a reasonable education should be able to write correctly, given a little time and care at the most.

I don't know if this is relevant, but it's possible to configure MagiC to load
and run applications to their completion before the next is loaded (I'm not
sure if this applies to the Auto and/or Start folders). Once the Desktop is
reached, the timeslice CPX can be used to switch preemptive m/tasking back on
(save this setting to have it executed automatically on subsequent reboots).

This operation is known to fix problems like the one you describe.

Milan Computer just put some pictures from last week's Atari show on
their site here:

www.milan-computer.de/de/news/neuss0600a.html

Click on the small links in the upper right ("Milan Stand" and "Andere
Aussteller") to see the rest of the pictures.
The pages are in German only, unfortunately. As everyone probably
knows, Milan hasn't updated their English-language page in two months.
Gibt es hier Freiwilliger? Any volunteers?

Does anyone know of a site that posts Atari-related news in English
promptly and regularly? Most of the Atari WebRing pages are a little
dated.

(For what it's worth, this is my first post to comp.sys.atari.st. I own
a Falcon that I bought during the first week it came on the market back
in whatever year that was. Will I be banned if I admit it's gathering
dust in my closet?)

Hi everyone,

I was wondering if the following Atari user groups still exist:

Houston Atari Computer Enthusiasts
Atari Boise Users Group
Nova Scotia Atari Computer User Group
Yolo Atari Club

We haven't been sending out newsletters to the groups on our exchange list, but we'd like to start again.

Thanks for your help!

Phil @ ABACUS (San Francisco, CA)

P.S. If your user group would like to exchange newsletters with us, please send me private email.

That may be the toughest or at least longest enduring problem.
Dolmen took into account instructions that exist for the 040 and 060
that the 030 cannot utilize. I have toyed with an 060 installed on an
Afterburner for almost two years, and while I am no Centek, it will be
no easy task to get the 060 to boot on the Falcon without a modified
TOS installed in the Falcon ROM socket, or a boot strap code burned
into cartridge port roms to get the 060 to start. That's a bitch as
the cartridge port cannot hold a complete version of TOS.
The nature of the beast is the Falcon cannot boot from the expansion
port, unless Centek (or whoever) remaps the ROM socket to the expansion bus.......
Sure wish it was a different story, but even in the 060 Amiga world, a
different ROM is used to boot the machine due to incompatibility with
030 instructions. But I won't give up...... Petr, where is the super
ROM? :)

After reading Shiuming earlier post, I would think that adding the
CT2B above the NOVA would work. My CT2B has been sold, so I
can't test that idea however. I didn't realize that the old CT2 (and
2B) have a 32bit expansion connector, but should treat the NOVA at a
16 bit device if installed below. I can run my NOVA at 25 Mhz on the
Might Sonic, so the bus speed shouldn't be a problem with a heat sink
on the NOVA chips.

>
>Just tkrom4f.prg, pcibios.prg, mintnp.prg (1.15.9, and all other versions
>I've tried) and fvdi.prg (in that order) doesn't work, fVDI crash with a

I usually run a whole bunch of other things too, but the order above
looks fine. I've not tried MiNT without memory protection, but that can
hardly be any worse.

>bus-error when loaded after MiNT. If it's loaded before, the program that
>opens the physical workstation crash with a bus-error.

Did you try with ERR_RPRT.PRG? That should, hopefully, give some
information as to what caused the bus error.
If MiNT traps the error, doesn't it normally at least tell you what the PC
was? That, together, with the addresses fVDI gives at startup when using
the 'debug' option, should also suffice.

>I suggest that you send me the binaries (tkrom4f, pcibios, fvdi) you're

I'm using exactly those in the fvdi095.lzh archive (well, as I'm sure
you've seen in another thread, FVDI.PRG and RAGE.SYS have been updated now).
I've not done any reconfiguration of tkrom4f, since the configuration
program I have doesn't seem to be correct. It certainly doesn't report
quite the things that are set in the tkrom4f sources, and that has nothing
to do with the modifications done for the PCI BIOS.

What configuration program do you use, and what does it report as the
original settings for tkrom4f?
Perhaps you could send me your configured tkrom4f?

>using so I can try those, it's most likely a version-conflict or the
>configuration of the AB-driver.

After experimenting a bit the configuration program I have, I'm leaning
that way. Please, try with an unmodified tkrom4f.

There's also a new option in the latest FVDI.PRG that could potentially
help if the problem has to do with the memory allocation, 'nopidalloc'.

Other things I'm investigating are vector bending clashes and supervisor
stack overrun, but I don't think problems in those areas should cause
bus errors at startup.

>With MagiC I only get a lot of mess on the Eclipse, but I also recall that

What kind of mess?

>I had a similar problem under TOS which I ofcourse has forgotten how I
>solved ;-)

;-)

>NVDI doesn't make a difference here.

OK. That should certainly make it easier to figure out what's going wrong.

7043. FS: ST Mega 4, SM124 & 60Mb Drive

Newsgroup: comp.sys.atari.st
Date: 2000-06-14 00:00:00 UTC
From: Julian Lewis-Booth <julian@portland.co.uk>
Message-ID: <39477643.0@london.netkonect.net>
Source record: 60924

Hi There,

I bought this recently, remembered how much I liked the ST, purchased a Falcon and no longer require this machine.

If there is anyone interested in this little lot I am open to offers (a TT for instance;-) I would like to sell this as a whole, the Mega has an enormous graphics card plugged into the expansion slot, though I am not sure what it is.

I was hoping for about £100 for the lot and will consider splitting, the hard drive and monitor are in nice clean condition, the mega 4 has worked and the plastics have discoloured slightly.

The mega has TOS 1.02 (I think, it is amazing how rusty you go when PC's and Macs are around) and is 1987 manufacture.

Regards

Julian

I bought a power supply from Allied Electronics, made by Oryx, that fits into an ST or a Mega. It also has slightly higher power rating than the original Atari PS. Not sure if it will work in a TT but I'll bet Allied sells one that will fit. I believe I paid about $70 for it, which is twice what a PC power supply costs. I'm still trying to find the documentation and will post the details (part #) if anyone is interested.

Roman numeral pagination is standard for any introductory materials in the English language. So you need them for anything that has an introduction, preface or table of contents. I notice that the English Manual that came with Papyrus back in 1994 uses roman numeral pagination for the Table of Contents. Clearly it wasn't set with Papyrus. Are you listening Ulli? This is not an "extra" in English.

Thanks to Galen for backing me up on the footnote/endnote problems. My guess would be that these requirements must not be standard in German, otherwise they would be available in Papyrus already.

While the number of people who actually do academic writing may not be overwhelming, in the United States it is the faculty of a university that will have the say as to which word processor will be standard on a university network. At my university that means 9000 students come into regular contact with Microsoft Word for four years of class work. Chances are they will continue with that software when they graduate. Making Papyrus conform to academic requirements is simply good business.

I'm not sure I understand exactly. Are you saying the Behnes have rewitten
the Atari standard so that high resolution is 93dpi? Wouldn't that be a bit
silly? Or is it possible that in conforming to NVDI 5, Papyrus does not get
the scaling correct with all previous versions of the font engine. Maybe
this problem does not occur under NVDI 5. Is anyone out there using NVDI 5
with TT medium? Can you get over 6.5 inches plus the window borders on your
display? Is the normal view consistent across all programs that use speedo
under NVDI 5?

Okay I'm sorry everyone but I meant to say it was unvailed. The two
on show were, I suppose you could say beta ones, prototypes. They
will be manufacteured in batch after they sort out a few niggles/fixes.

It was on show with EDO RAM and I think they might be changing it to
SDRAM for instance.

Again I'm sorry to the all those who got the wrong idea about my
posting. :-(

Hi everyone

I've designed and should be making in the next month a HD module.
This allows you to connect most PC Floppy drives.

This gains access to PC disks, also allowing you to use HD disks as DD are getting rarer. 1.44mb of storage on each disk for those big files.

The module is about 25mm by 65mm by 5mm high. It's compatible with quite a few PC drives. On the HD pin some drives give high state when in HD access and some give a low state in HD access.

This is overcome by jumpers mounted on the board. Also it's compatible with a combination of drives configurations.
A as HD, B as HD or even both.

Only one chip leg has to be cut and about 6 wires to solder. The module will be quite cheap (hoping to be around the 10 pounds mark).

It needs TOS 1.04, TOS 2.06 recommended as it has 1.44mb formating option in the standard desktop formatter. Also the WD1772-02-02 Floppy chip or even better AJAX is required. NO software drivers needed, except for formatting disks (<TOS 2.06). Formatters can be supplied (can be got off FTP though).

PC drives have to be bought by your self or possibly supplied by me. Some PC drives don't give a signal out when it's accessing HD mode, therefore some drives need more work done to them i.e. soldering a wire to the Floppys PCB. Most drives have to have a little mod done to prevent data corruption and a jumper changed on it to select it as drive 0.

A bit of modification to the PC floppy drives plastic front or a different sized hole is needed as PC floppy drives have a different front.

Having an external HD drive as B is possible but getting the casing is difficult. Power supply is needed too.

Email any enquiries to my email address in sig but if you think that everyone else wants to here about it then post it here!

TIA ;-)

>
>Look at it this way - Apple develops Macs, UMAX wanted to develop Macs too,
>Apple bullys UMAX into closing up shop. Would you say this is an acceptable
>tactic? And what about Mac OS :)

No, it isn't an acceptable tactic. I also think it was a stupid tactic. For a brief moment there, the Mac world had a chance of commoditizing like the peecee did, but then Jobs moved in and shut down the clonemakers. Possibly good for Apple, unspeakable bad for the overall Mac world. But I'm not so upset about Apple's actions, since they don't affect 90% of the computer world.

What about Mac OS? I don't know anything about Mac OS, except obviously only Apple produces it, every Mac ships with it, you can't get retail shops to install LinuxPPC or Yellow Dog or whatever, so from that point of view, it's very Microsoftish. Again, Mac only represents a small fraction of the world, less than 10% now, I think (where's Sinclap when you need him?). It IS interesting to see even a token move on Apple's part toward open-sourcing parts of their precious OS.

>And Micro$oft open-source Windows, should everybody else do the same?

Anybody else in a position of owning 90-95% of the OS market and using their proprietary edge to dictate terms to the world? Yes.

(Shucks, I wish we could see TOS open-sourced!)

>> The only reason ANY other peecee OS is out there at the moment is because

>rebuild you PC if you don't shut down properly? Again - there's nothing
>wrong with BeOS either, but its all about compatiablity and regretably
>Microsoft have cornered that.

Agreed, Linux has been out there ON THE FRINGES since, what, the late 80s, but it has only been since the growing uncertainty of MS' future that Linux

has mushroomed into a valid competitor. Is it there? Of course not. Would it ever even have a ghost of a chance with the evil Gates empire firmly in control of the market? No. We would still have those wonderful OEM agreements that prevent anything but MS slime being installed by/for anyone but hardcore hackers and MS-haters.

On the other hand. I have to acknowledge the Open Source argument that Linux represents a battle that Microsmash, with their monolithic closed-source worldview, is ill-equipped to deal with. Linux may have succeeded in spite of Gates' best efforts to quell it, but I am fascinated to see how it has blossomed (no, like I said, not there yet!) with just a little restraint on Redmond.

As far as BeOS goes, the original premise behind Be was to explicitly dump the backward compatibility legacy garbage and trot out something new, powerful, and fresh. I'd say the OS is all that, from what I've seen, but they've had even more problems with encouraging usable apps than the Linux world. But coming from an Atari background, where compatibility with MS products was always slim-to-none, we could ask if it is really the compatibility issue that is hurting us, or other things, or a combination of everything that is driving Atarians to peecees.

>Atari emulators are great if you want to run Atari software on a PC - but
>that doesn't really help the matter (i'd much rather have a real ST).

Me, too! Or rather, a real Milan, available from US dealers. Now. With a decent browser.

This is true. Switching down to 25MHz for every motherboard
access would potentially generate electrical noise, and is
also no so good for performance - so it runs at 50MHz all
the time.

That was it! I just tried with an unmodified tkrom4f, and here I am,
looking at some very tiny text in Farmer. I used a 6pt font since I had to
use the Videl, at 1280x1024 that's rather small ;-)

Everything is slow as hell though, the colours are all messed up and the
background gets more and more distorted for every redraw, but I'm going to
tweak the setup now.

> What kind of mess?

It's hard to explain, I can vaguely see what's happening but the picture
is very distorted. I tried to make a snapshot of it, but it actually
turned up correct when I viewed it under TOS...

Perhaps, but there's a huge difference between my 1Mb DRAM-card and Magnus Kollberg's 4Mb VRAM-card, so the hardware definitely makes a difference. E.g. "high" refresh-rates in 16-bit (800x600@60Hz...) slows it down a lot compared to 50Hz. 1280x1024x16@75Hz on the Eclipse is a lot faster, atleast under TOS.

> You really ought to try a vector drawing program like ArtWorx or

I've never used these on the Nova so I couldn't tell the difference anyway ;-)

From: jba4@po.cwru.edu
Message-ID: <3947e08b.12580736@news.cwru.edu>
Source record: 60941

Hey everyone! I've recently installed gcc 2.95.2 from the SpareMiNT page and the matching version of g77, the Frotran compiler. I also installed the latest version of ld (version 2.9.1) from the binutils package also available on the SpareMiNT homepage.

When I attempt to compile a valid Fortran 77 file, I receive an error from ld. It is actually a bus error and ld spits out that an internal error occured. I am currently running freeMint 1.15.5 without memory protection enabled on a TT. Any ideas? I really need the Fortran compiler running for work. If you know of any other capable Fortran compilers for the Atari, I'd appreciate it too. Thanks!

I think its probably a combination of several factors, I hate to say it but
one of the main factors is probably the lack of a decent browser - don't get
me wrong, CAB is great for viewing HTML pages, but most sites incorporate at
least some Java (or javascript) - If we had a browser that did Java we'd be
laughing :)

> >Atari emulators are great if you want to run Atari software on a PC - but

Too right - anybody know is System Solutions is going to be selling the
Milan060 in the UK????

Cheers.

Matt.

7065. SpeedoGDOS???

Newsgroup: comp.sys.atari.st

I was wondering if SpeedoGDOS is something that is available on the net
for download? I've done some searching including ftp sites and have
found nothing. I'd appreciate any info anyone has,
Cheers, Matthew.

7066. FS: Falcon030 4/80 w/SpeedResolution Card

Newsgroup: comp.sys.atari.st
Date: 2000-06-15 00:00:00 UTC
From: Derek Warren <macgod@rocketmail.com>
Message-ID: <140620002058559572%macgod@rocketmail.com>
Source record: 60862

Hello, all!

Before Barry (aka Phantomm) became unreachable, he did allude to the fact that he wouldn't mind me selling my bird to someone else... so here goes. <snif>

In the package:

* 1 Falcon030, very good condition.
* 4MB RAM, 80MB (stock) IDE Conner 2.5".
* comes with Hard&Software's SpeedResolution card + drivers (36MHz 030 acceleration, accelerates video ops, too..)
* recently replaced 1.44MB floppy drive (had to remove an FDD-foot and a copper 'stand' to do this--included)
* US power cable (ooh!); no mouse
* RGB->VGA video adapter.

I received this machine with no mouse, and found that the internal fan had been disconnected from the motherboard. I don't have much in the way of software for it, either, so I guess it'd be better off in the hands of an experience bird-curator. 8)

I'm located near Vancouver, BC, Canada, but I'd be more than willing to ship to the USA (or abroad, provided I can get some advice on what to do and what not to do!). Asking price: $325USD. Other reasonable offers are always welcome! Contact me *privately* with offers via phone [(604) 945-2877], e-mail [derek at trideja dot com]. Got other questions? Feel free to post 'em here. I've been more or less lurking around CSAST since I got my MSTE last year.

Reason for selling: ... well, I've had this machine for about eight months thinking I'd upgrade it and make it a nice alternate desktop machine.. not so! I got "ST fever" a few years ago when I first saw an STE in action, and a few years (and several ST/es) later, I decided I had to experience the Falcon.

Looking at what it'd cost me to beef it up so I could haul use it as a serious desktop replacement would simply be too much for me. I'm off to university next year (moving out) and I've got to pay the bills somehow... for this reason I'm also in the middle of selling my Apple Newton MessagePad 130, should anyone happen to be interested.

Enough blabbing!

Cheers!

| . . . .
|Roman numeral pagination is standard for any introductory materials in the
|English language. So you need them for anything that has an introduction,
|preface or table of contents. I notice that the English Manual that came
|with Papyrus back in 1994 uses roman numeral pagination for the Table of
|Contents. Clearly it wasn't set with Papyrus. Are you listening Ulli?
|This is not an "extra" in English.
|
|Thanks to Galen for backing me up on the footnote/endnote problems. My
|guess would be that these requirements must not be standard in German,
|otherwise they would be available in Papyrus already.

I recently had a book 'published' which I edited with Papyrus. Had
to put in the Roman numerals by hand.

In years gone by I wrote a couple of times to HiSoft suggesting a
proper referencing scheme for Papyrus. This would need to take into
account the fact that the same article might be referred to several
times, that the order of the referenced articles might change etc
etc. I got no feedback whatsoever.

fVDI works fine with MagiC (6.10) now, but I have a general problem with
MagiC (it doesn't matter what else I have in the autofolder) that I think
can be fixed by this. How do you disable preemptive multitasking in
magx.inf?

> this can be sorted. I guess you didn't have any problems with the Nova
> installation (aside from the animated GIFs one from an earlier thread).

I had *lots* of problems, both with getting the Nova itself to work with
MiNT and MagiC, and even more with several applications. I believe I went
through five releases of Nova-VDI before Papyrus finally worked in 16 bit
colour. Not to mention MagiC and N.AES, which had to be upgraded to use
the correct palettes in 16 bit.

However, nowadays most applications seems to work fine with graphics-cards
so I expect less trouble with fVDI than Nova-VDI over time.

>>This should be fairly easy to do, you need about 20mm clearance but that's

> That's still quite a lot - I can't think of an easy way to implement this ATM.

That's easy, just stack two connectors on top of each others. Titan used
to sell these with the AB (they're needed with some expansion-cards as
there's a very tight fit between the CPU-cooler and expansion-port), but
you can find them anywhere.

7071. TAF Flea Market June 21st

Newsgroup: comp.sys.atari.st
Date: 2000-06-15 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-54CE04.07294915062000@bigmomma.idirect.com>
Source record: 60867
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

TAF Home Page: http://taf.atari.org
Ken Macdonald, TAF President + Mario Becroft agent: 416-533-0504 or anarkist@idirect.com
Dan Dreibelbis, TAF Vice-President and Sinclap Tamer: 416-766-4743 or dreibel@idirect.com

: Silly question, but won't adding another fan put more load on
: my already "on the edge" PSU? Bear in mind I don't know the
: power requirements of a fan per say.

Incidentally, I just bought a fan today and it says on it what it's power consumption is. Normally it pays (powerwise) to install a fan. If you like to experiment you could try using better passive cooling. Much bigger cooling elements, maybe even some kind of water cooling system.

Another solution would perhaps be buying a car battery and eliminate the PSU altogether?

There are also lots of descriptions on building various PSU:s in electronics magazines.

Easiest and cheapest is to get a PSU from a PC. Or a Mac. The only problem here is the form factor, how to fit it. Try searching the web for producers of PSU:s, I have found some nice fanless Aztecs that seem to fit the TT casing.

When I use Calamus and i set the display of the page on 1:1 then a
printed 12-point character should be exactly as big as a screen-
displayed 12-point char. And a A4-paper on screen (if it fits) should
be as big as the real paper.
I have always set my screen so that this is true.

I am not sure but Calamus thinks about the b/w screen as 96 dpi. Or
am i wrong?

TeX used to be very popular with the students here in Signal Processing,
but gradually more people have migrated to PCs rather than workstations,
and as most get Word with the machine, they use that. Maybe if TeX was
included with the machines more people would use it. Probably another
major factor is that many conferences and projects define Word 6 + as
the official file format, as well as pdf.

(Having said that, I have TeX on an ST at home, but switched to Word for
the same reason.)

Hi Peter,

Right, and the COMBEL divides the main clock to the motherboard by two.
That's why there is a 32Mhz clock (not visible on PAL systems) to feed
the COMBEL, which gives you a 16Mhz Falcon.

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your reading for my Free catalogs, jump to the bottom, otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet & some Cartridges for the ST like DVT VCR, ST Replay & Computer Eyes! So come and Get it! First come, first serve.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, &

my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Complete Digital Recording Package!!!

No matter what your experience level, this package can make your recording dreams come true!

Everything you need to get started:

Atari Falcon 030 (computer made especially for digital recording)
500 meg SCSI harddrive (attach other SCSI devices such as CD Burner)
Cubase Audio 16 (fantastic program for tracking...16 tracks audio...endless midi tracks)
Monitor
Mouse
Other software

ALL for ONLY $650 (firm) plus shipping!!!

Now where else can you get such a great package?

E-mail Carolyn at note-able@prodigy.net

They have definetely no need for another web browser! And none of the open source browsers supports Flash... but if you really need another web browser start Basilisk and use Netscape 4 or MSIE4.5 :-)
I only hope that one day there will be only one TCP/IP driver. It's hard to explain why there are 5 of them on the Atari (although the programmers had their reasons). Then the Milan needs at least a couple of games. Almost all of the old ones don't work and most GEM games look boring.

Greetings,
Matthias

I'm thinking the B&W default is 93 dpi. But it's really just a starting point. All monitors are not equal, so the screen display resolution in Calamus is adjustable, to something like 5 decimal places. I have the first version of their B&W monitors (the one made by Moniterm, not Phillips) on my TT, and I believe I had to set the resolution to 91.???? to get the screen to display the size correctly.

And even that is not foolproof. <G> I assume here that "Word 6 +"
means the file is to be saved in MS Word 6.0 format. (There were
version 6.0a, b, and c, btw.) Unfortunately, the backwards
compatibility of Word is not foolproof, especially in the areas where
you use Visual Basic macros and features in the newer programs the did
not exist in the older version. Microsoft's forward compatibility is
not foolproof either. <G>

From: Ulli Ramps <Ulli@rom-logicware.com>
Date: Thu, 08 Jun 2000 01:20:03 +0200

Hi Ulli,

>>When the dictionary holds 200000 words (the minimum to work with a
>>reasonable degree of comfort), you'll soon find out that it's useless on a

>>TT. It can take up to 15 minutes before the dictionary is loaded into
>>memory, and once that's done Papyrus can not keep up with the typist....
>
>It can, no problem. The German dic for example is much bigger, because
>German
>has much more word derivats, it's more complicated.
Sorry, but my experiences are different...
Because the Dutch dictionary that is supplied with Papyrus is not really
valid anymore (new spelling rules), I constructed my own Dutch dictionary.
This contains roughly 375.000 words and the file is 3MB long. Loading that
dictionary into Papyrus takes *minimum* 25 minutes!!
Supposing anyone has the patience waiting that long, and finally starts
typing his letter, the dictionary can't keep up with the pace of the typist,
and I'm not really a very fast typist (four fingers)...

>But why do you feel that the two dics aren't enough for a good start?
>They come from Wintertree, and they do a very professional job selling
>their dics to companies like us ...
Because they give the (false) impression that spelling correction works fast
and speedy while it isn't. I never disputed that the dics are no good, and I
don't doubt for a minute that Wintertree do a very professional job.
Unfortunately it's the routines used in Papyrus that are to slow, while
we're on the subject, why does it take 25 minutes to load 375.000 words? TW
loads the same dic in less then 15 seconds, and it's able to follow the pace
of the typist easily.

>> Not surprising really, Papyrus itself is also slow and clumsy, so I
>>suppose that's what's ment by "synchronised" applications ;-)
>
>Hm? Silly, sorry. Papyrus is written in Pure C, completely, and totally
>Atari-based.
>It's fast, as well, when it is not that fast than 1st Word, then you
>have to look at the differences in concept, first - it is a totally SYSTEM
>CLEAN written application!
Hm, could you define fast please? somehow we seem to interprete this word
quiet differently...
- On a TT and a Hades040 scrolling is slow and chunky
- formatting or reformatting a big text (+100 pages) can take forever

- Importing big ASCII files gives the word "fast" a total different meaning
...etc

I also don't really understand why ROM decided to replace the hyp file with that help.pap document. Once the hyp file is loaded it gives instant help, now I have to sit here watching Papyrus opening a doc. I also have the impression that a lot of topics aren't covered by the doc, while these topics were covered in the hyp file of version 7.5
e.g the option dialog to set screen resolution, use memory sys etc...

Cheers from Belgium
Dennis

Hi Matthias,

>The Milan II comes with Adamas (1.71 or later) and it works quite well
>for a lot of people.
Sorry, but I have to agree with Dan... once again Mucs managed to make us
pay 59DM for an update which is still crap.

I've asked you this before, and I'll do it once again....
Please give me a couple of JavaScript URL's which can be reached and
displayed by Draconis Pro without generating an error, bombs or a complete
lock up of the computer...

The only reason people bought the Pro version is because of the JavaScript
capabilities, Adamas can't do it... that's all there is to it.
BTW: Have you noticed CAB running on the Milan's at Neuss? I think this is
a sign of what is to come... IConnect is already part of the bundle anyway.

Cheers from Belgium
Dennis

From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <8idevr$p0v$1@nnrp1.deja.com>
Source record: 60805

Hi all,

Me and Dan Ackerman has been working together for some time in an effort
to provide Atari users with an ICQ-client for Atari that uses a GUI.

It is a shell + overlay concept, where the shell is written in GFA by
me, and the OVL in C by Dan. The OVL is written to be STiK-compatible,
and appears to work ok with STinG and Gluestik too. The shell seems to
be compatible with all OS flavours it has been tested on so far.

Note that you _must_ have an ICQ-account to be able to use it online!
Please be aware that this is an early version, so do not expect
everything to be 100% ready just yet. ;)

For more info and download, go to:

7102. Re: SV: SV: CT2 rev A through-port pin-configur

Newsgroup: comp.sys.atari.st
Date: 2000-06-16 00:00:00 UTC
From: Mike <magicmac@my-deja.com>
Message-ID: <8idgf3qca1@nnrp1.deja.com>
Source record: 60806

Hi Peter,

I wasn't laughing at you, I just found the thought of running the Falcon DMA at 50mhz a bit funny:) Actually, the DMA runs off the same clock (32Mhz) as the DSP (that's why you need to cut the clock trace to the DSP to up its speed) You cannot run the DMA internally any faster than 32Mhz, in my experience There are alternate inputs available through the DSP connector to the DMA, but you would have to look at the schematics to get and idea of the logic that goes with that. With all the magic dust I could find, a 25Mhz COMBEL signal was about the maximum clock the DMA could handel, and still perform relaiably. It was very buggy if the machine was using higher bit planes, but works fantastic if you have an FX card installed. Anyway, the COMBEL divides the 50Mhz CT2 clock several times, and the /2 is what the bus uses. Looking at it with respect to the CT2, if you are processing data, and that data is stored in alternate ram, and no XFR other than floating point is made, you will be operating at 50Mhz on a 32bit bus. DMA, Video and other operations require the CT2 to access the Falcon bus through the expansion connector, with 68030 timing.
I know the CT2 is fast, and a decent piece of work. Not much else out there. But.... If I run my Mighty Sonic (68030 with alternate ram, no 32bit FPU mapping) at 45Mhz, benchmarks indicate that it is running near the speed of a CT2. Of course there are a shit load of technical improvements that do boost the speed of the CT2 such as memory access, floating point, alternate ram access at 50Mhz as opposed as the Mighty Sonics 22.5Mhz half speed access and other aspects of the card that make it slightly superior. My main interest in the one that I had was the 128mb alternate ram capacity. Would have been nice to have for use with Expose, if indeed any expansion cards other than Centeks will work with the 2B or not??????
Really, the Field Service Manual should be made PD, in its entireity:)
Please excuse my spelling and English, i'm a native:)
Regards,
Mike

7103. Atari 1040 ST Sound

Newsgroup: comp.sys.atari.st
Date: 2000-06-16 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <p6s25.5315$Rz5.187390@news.magma.ca>
Source record: 60807

Hi,

I recently acquired an Atari 1040 ST computer and color monitor. Where is the sound produced on the 1040 ST? Do I need speakers? It has a MIDI IN/OUT ports, but I do not believe you would use those ports for sound in a game. The monitor has no obvious speakers, and the volume controls on the face of it are not adjustable, which leads me to believe the monitor was manufactured without sound. I should mention, however, that the monitor is made specifically for the Atari ST, and I am not trying to hook up an off-the-shelf display device.

Thanks,
Michael

I agree, but I really don't see either Best or B&C doing that
any time soon...

I suggest the follow correction then:

Look for Arial, Swiss and Helvetica. The first one found is used.

> > My reference to roman numerals should have been with pagination. Many

> I see ... So it is kind of an English standard, then?

The same standard exists in French and _many_ other languages.
Pages in the Preface and Appendix often use Roman numerals.

Btw, one important thing would be to use ST-GUIDE files for Help,
instead of a text file in the Papyrus format. Having to wait 5
minutes for the help to load and format is a _MAJOR_ annoyance.

7109. For sale! Bargain!

Newsgroup: comp.sys.atari.st
Date: 2000-06-16 00:00:00 UTC
From: dark__lord@my-deja.com
Message-ID: <8idn41tjk1@nnrp2.deja.com>
Source record: 60813

For sale, continental USA only, the following
software package, will NOT break up. Will take
offers for 1 week, then it goes in the trash,
need room for new computing platform. ;-(

Submit by e-mail only, please!

Running (Falcon - reg. copy)
Pagestream ("light" edition - paid $39)
Teknoball (reg. copy)
Llamazap
Ping 2000
Desktop Solitaire
Arena
Extendos Pro Gold
Anodyne CDWriter
Anodyne CDWriter +
Phase4 Cybercolor
Obsession
Homa System CD's (Infopedia/WW2/Space Missions)
Ishar Trilogy

As you can see, this represents a fair amount
of monetal investment. I'll take the first $35
or best offer inside of 1 week. Otherwise, its
deep-sixed. ;-(

Remember, first $35 gets it!

Does not include shipping and handling.

Thank you.

For sale, continental USA only, shipping and handling NOT included.
I have the following Atari specific CD-ROMs for sale:

Renegade
Atari Compendium
All Things Falcon
Bird of Prey
Stratos CD
STUG (ST users group)
Moving Pixels.

Over $100 + worth of CD's, will let go for first $25 plus S&H, or
at the end of a week in the trash it goes. Need room badly for new
computing platform. Will not break up. Send replies via E-mail.

darklord@kih.net

Thanks! ;-)

So in other words, Draconis still isn't there yet? This is something that people have been curious about for quite a while, but we never did get a solid answer.

How does it do with everything else? What versions of HTML can it read? How is it's rendering engine?

Give us the dirt!

Hi Michael

The ST was equipped with the Yamaha sound only, unlike the STe that
had PWM 8 bit sound. The STe has Phono (RCA, like the TV out socket)
but the ST didn't. Don't worry thogh it still has audio, just mono
and not that much good, but OK for games. The audio is from the
monitor connector and your monitor doesn't have a speaker so you'll
need to hook one up.

Open up the monitor plug that plugs into the ST. Connect a wire to
to pin 1 (audio) and pin 13 (ground). Connect these to some PC
speakers *with* built in amplifier. Look in the Atari manual near the
back for the pin numbering (shown from looking at the sockets on the
back) or email me if you don't have one and I'll help you out.

Midi is not used for games except one I have called "Kings Quest IV"
and require an external sound box.
The rest of the games use the inbuilt Audio from the monitor socket.

From germany: on PD disk from St Computer (343) the following:

copyright 1990
BC-FORTRAN77 VERS 1.3C
Andre Koestli
Martin-Luther-str. 63
D-7000 Stuttgart 50 (old postal coding)

It has editor, compiler linker. And some (oldfashioned) libs.
It likes a command shell so that should be a plus for enthousiastic
MiNT users {:-)

But integer*4 is the same as integer*2 (16 bits)

And further: from the UK: PROSPERO FORTRAN77!!!!!!

The idee of placing the Milan in the market as a easy-to-use-internet-box will not happen in time.
There is not and will not be a MONKEY-PROOF Milan Internet box and browser.

My advice is: Make the Milan a MUSIC-BOX.
There are many musicians using old Atarai stuff wanting new stuff.
There is no computer on the market that has the precise timing for professional music making and the cheap hardware.
Something like a Milan with a StarTrack but without the pricetag of $700 ex computer!

Score Perfect, Cubase, Notator etc...

Yes I agree, in these days a compiler is oldfashioned. But a few
years already there WYSYWYG versions: modern computers are so fast
that interpretation in stead of compilation is possible.
The interface is also graphic so if you do not know, it looks
like DTP-ing. Very much more userfriendly than 5 years ago!!

Question is if my micq port works under Ifusion. If it doesn't I
would say that Ifusion has bugs in it's udp code. I have no certain idea
on this though. But as far as I know this program and micq are the only 2
STiK API programs that heavily use UDP. Most everything else uses TCP.

Exactly what I was thinking... Applause... If there's a future for Atari clones it is with audio/midi apps, not dtp or browsers.
Imagine this: midi and HDrecording on a 060 machine. Done well it could compete with all the blackbox HD recorder stuff from Yamaha, Roland, Fostex whatever.
Unfortunately the German developers seem to be completly unaware what made Atari big. Sigh.

Great! You guys are awesome! Does this use mICQ to make the connection (i.e. is it just a shell for the TTP program), or is it a separate, stand-alone program? If it's a stand-alone program, are you planning in the future to add full 2-way chat support? With my family scattered all over the country (and all but me owning PC's), they often use ICQ to chat with each other, but since there is no 2-way chat on mICQ I'm left out. :(Hopefully this will change soon!

Although it's described as a shell and OVL, it feels like one
program so don't let the design confuse you. It comes with
all the parts you need, just run it. Easy as that. You don't
need the old micq port to use it. Hope that helps. ;-)

It's not a rumour but they've been very quiet about it. Personally I
don't think that Basilisk will be that important for the Milan because
it won't work with the latest Mac software. And you still need the Mac
roms...

> (It would make it possible to use iCab ?)

Certainly. But why use iCab when you can use Netscape and MSIE on
Basilisk?

Greetings,
Matthias.

>>My advice is: Make the Milan a MUSIC-BOX.

In what way? It would still be a highly capable Super Atari
that many ST enthusiasts would love to have for their general
computing duties and pleasures.

Today's Atari musicians in summary:

1. Those who use it because the machines can be picked out of
a waste skip and cracked Atari Cubase grows on trees. These are
the same guys who will phone an Atari dealer, ask questions about
products, then ask where they can get it cheaper.
2. Those who are real professionals and have reached a very high
proficiency, using it to great effect within its limits because
they have developed a deep understanding of the system. They
often have a regular stream of work which prevents them exploring
further, because they are too busy.
3. Those who are easily charmed by flashing lights.
4. Those who realised the other potentials of their Ataris and
became Atari enthusiasts on the side.

Group 1 would sooner be struck down by disease than spend
money on Atari stuff.

Group 2 can usually do everything they want to with just
their Atari and a little bit of extra gear.

Group 3 doesn't really make any music, never finishes anything
and will buy a PC (and not a Mac, because they're too blind to
see that a computer has maintenance costs in addition to the
purchase price) because that's what their friends use.

Group 4 is the type that frequents this newsgroup.

Which of these will buy a Milan "Music" machine? Only group 4.

>>There are many musicians using old Atarai stuff wanting new stuff.
>>There is no computer on the market that has the precise timing for
>>professional music making and the cheap hardware.

The problem is, these days, soft-synths and "plug-ins" are all
the rage. Those things *eat* CPU power, and therefore,
co-processing DSP arrays such as CreamWare's scalable PCI-based
Pulsar and Scope cards are taking music creation to the next level.

As a pure MIDI engine, even the humble ST is still an excellent
machine, but running plain audio alongside became "boring" almost
as quickly as the Falcon. "Plug-ins" and software synthesis are
the next in-thing.

>>Something like a Milan with a StarTrack but without the pricetag of
>>$700 ex computer!

Startrack is still a competitive card for the money. You get
very high quality A/D:D/A as well as a DSP56002-66, plus the
compatibility with SoundPool's Falcon audio products, so it
goes some way to maximising the value of software investment.

>Exactly what I was thinking... Applause... If there's a future for Atari
>clones it is with audio/midi apps, not dtp or browsers.

What made Atari popular for music in the old days is no longer
elusive to the current mainstream platforms. First it was MIDI
on the ST, then, briefly, audio on the Falcon. Third time around
it is PC and Mac leading the way with massive DSP power solutions.

If there's a future for Atari clones, it's with developers who
design well-conceived software that performs truly useful
functions that are realistic within the limits of the hardware,
and users who are more discerning and in tune to technical issues
and what they want to achieve than the average PC-buying consumer
sheep. To say that part of its future is not in DTP when a program
of the calibre of Calamus SL is still being actively developed for
it is incorrect, too. So long as quality solutions are made and
informed people are buying them, there is a future, no matter what
those solutions are.

>Imagine this: midi and HDrecording on a 060 machine. Done well it could
>compete with all the blackbox HD recorder stuff from Yamaha, Roland,
>Fostex whatever.

Yes, but you'll get the guys who look at the price of standalone
gear, and then think it's cheaper than a computer (and in some
cases it may be) so buy the standalone solution. Unfortunately
this is typical consumer mentality. The man in the street doesn't
think like us enthusiasts, doesn't see clear objectives and buys
what everyone else has.

>Unfortunately the German developers seem to be completly unaware what
>made Atari big. Sigh.

If any of the "big" companies is going to create a desktop computer
solution to take on the dedicated outboard gear, it's going to
choose the most common and fashionable platform, regardless of its
technical merit.

I totally agree.

As you say the StarTrack is right up there with the best sound cards
as it's 96khz 24bit. And about musicians still using ST well thats
right as well. Anyone heard of Fatboy Slim....

If they did this they could get hold of the Music Industry, Milans
will be seen as cool like the old STs, people buy them for home
studios because it's "power without the price" make some
money and *then* make a browser, release the Milan 3.......and go on
from there.

Average PC owners want the simplicity and compatibility of Microsoft
programmes. To win PC owners they would need millions of pounds of
advertising across the globe.
Whereas word would get around the music industry of this new Atari
clone. They would be saying "hey I can use all my old programmes from
my dying ST, but with more power, wow look at the price tag" <cheesy>

All I'm saying is I can't see the general public going out and buying
a computer they've never heard of.

I still can't visualise this. I'd need to solder a connector to the Nova to
give it a through port, so that's a male/male component (but what?) Then
something to stack on top to add clearance, female/male.

I'm still waiting to hear if anyone else has got a CT2 working with a Nova
before deciding on a purchase!

Anyone?

Care for using the correct fonts! If doing so, at least by loading every important file (template_NEW.PAP, help\pap_help.pap) once and saving it again with your fonts, speed should not be a problem, any longer.

I don't see the sense of renaming the INF, but the rest is fine :-)

Papyrus 8.5, coming in July, will have configurable keyboard layouts.

Following our own policy, everybody who bought the English 8 is close
enough to that coming version to get it for free.

No I do not mean the little blue creatures. I mean the great image converter/processor. I just received my full version in the snail mail. It runs great under Magic and performs well. I will look to using it along with PhotoTip. I was shocked when m
y wife told me that she wanted to get a digitial camera.

Sure! MagiC Online is hosted on them, for completely no charge. They are very quick in responding to email usually, but perhaps are overwhelmed because of the latest offer . (AFAIK it's mostly handled by one man)
If you do manage to get a website hosted their, it's very nice indeed :)

> Basilisk?

except that the versions of those browsers that would run under
emulation won't have the proper security routines: those broke as of
January 2000. And the current versions of MSIE and Netscape wouldn't
work because A) they require a PowerPC processor and B) they require
later versions of the Mac OS, which also require a PowerPC processor.

iCAB, on the other hand, has a version designed to work under 680x0
Macs. I've read a lot of good reports from people on
comp.sys.mac.advocacy who've even been able to get it to work on ancient
PowerBooks.

Besides, you know that iCAB is a great program when Sinclap has been
waging a disinformation campaign against it in atari.advocacy.... :)

Ah, but JavaScript is not all it is cracked up to be!

Take a look at the comments by "Caveman Og" in the
news.admin.net-abuse.email (anti-spam) news group
where he discusses spammer's usage of JavaScript:

>Subject: Re: C&CL Spammer threatens to unleash virus
>for right clicking:

>None, read this, NONE, of these stupid spammer tricks work on anything
>other than Windows. the Javascript breaks elsewhere. Also some of
>these scripts are fairly IE specific.

>Having written cross-browser, cross-platform Javascript (and debugged
>the same for others). I can assure you that it is a MOST demanding task,
>and that even the cleverest spammer simply isn't up to it.

>Each new generation of browser means a slew of re-writes to keep
>compatiblity, so eventually these tricks may not even work on Windows.

>--Og

Quite simply ... every time another browser supports
or enhances JavaScript, more incompatibilities emerge
because JavaScript HASN'T BEEN STANDARDIZED. And that's
not even considering the massive security holes created by
a JavaScript-enabled browser, another reason more and more
web users are turning JavaScript "off".

If it were my decision, I'd skip the JavaScript and see
if the Java Virtual Machine (Sun Microsystems has handled
the standardization of Java pretty well) could be
built in to the Milan somehow. Now THAT would be an
impressive machine, offering TOS/GEM, MagiC, MiNT, and
Java all in one package.

Or they could put Java into the Milan III, just to ensure
the Milan II is available Real Soon Now in the US.

2 more cents:
Great idea for the Milan to be up-to-date enough to compete
musically and, idealy, there will be a browser for it that's
up-to-date also.
About browsers, according to Alexander Clauss, Javascript can be
realized with CAB but he doesn't feel there would be enough people
buying the program to warrant his time to do so! Other programers
could do it but they would need Alexander to release the source code
but he's stated, Quote: "the source code is not available"!
Maby he would he do it for the Milan (with the right incentives!!!).
Anyone know if he's been contacted on that?
As far as the other browsers go, they amount to just being rumors
until actually released, tested, and reliable (real nice if they're
useable on a Falcon or TT too).
Back to the Milan: The success of the Milan II (no matter what
it can do with the programs that may come with it or be purchased
separately) will depend on how it's marketed! Back in '87 (and today
also), the USA had never even heard of a "real" Atari computer
through TV/Radio ads. They were bought through word-of-mouth!
Can that be repeated today against the already entrenched PC?
To answer my own question: Yes, it's possible with enough support.
Anybody familier with the NY Mets knows! They may never be in every
World Series but their fans hung in there through times when they were
in last place making the Mets more than a viable threat!
Maybe that's a bad analogy but the point is in not giving up!
So, as in a war, until a new weapon is created and useable, the
best thing to do is fortify and bolster the existing trenches and

that means up-to-date programming for the computers we NOW have
and that the Milan II comes with ALL programming possible (music, Net,
games, busness, etc!).

Source record: 60754

This is just a suggestion. Is there any way that you guys could set up an online payment method for your shareware programs that would accept all the major credit cards? This would make it easier for users to pay you guys. No need to hassle with bank stuff and foreign currency etc. I am pretty sure most people have at least one major credit card. Thanks for your time.

Joshua.

Hello all,

I recently got a friend's TT working with a Crazy Dots I video card. I went back and used the regular monitor port and found the screen on the monitor was not completely filled up like it used to be before I used the card. Now I admit I am having the TT boot from a disk and then I run the ICDboot.prg to get the HD devices. Is this some sort of fall out from using the card?

That would be nice, but most shareware authors like either cash or a cashier♦s check. I have registered about 15 titles in the last year or so that way.

7164. Aniplayer 2000 Upload v2.11

Newsgroup: comp.sys.atari.st
Date: 2000-06-17 00:00:00 UTC
From: didier.mequignon@wanadoo.fr
Message-ID: <8ig27l$5av$2@wanadoo.fr>
Source record: 60762

Hi,

There are a new version of Aniplayer 2000 on my site:
The playlist is better and the MP2 is more fast than MP3
on a Falcon with DMA transfers.
For example I obtain on my CT2B with MagiC with an:
MP3 128 kbit/s 44,1 KHz stereo 16 bits .... 25% of CPU load
MP2 128 kbit/s 44,1 KHz stereo 16 bits .... 15% of CPU load
For info MP2AUDIO of NoCrew is to 0% but all code is in the
DSP memory. Here there are all code based on ISO sources for
MP1/2/3 with the little DSP memory.
There are others news like the possibility to set the D2D
buffer at 1 to 5 seconds for audio files.

Regards,

Didier.

That's interesting! On a somewhat similar topic, can you tell me if you can unpack PC-type TTF files on an Atari that have underscores as part of their filename extension (such as those supplied by HP on their DeskJet 520 disk, say ARIBL0.TT_ etc.). Actually a friend of mine extracted them for me on a PC, but I was wondering if it could be done on an Atari. It can't be done by renaming them to .ZIP or .LZH!

#Hallo Derryck!

DC>Looking at the Nova bus adaptor, does it look like it would be
DC>possible to fit a bus extension to it for a CT2B, and how much
DC>clearance is needed for the Nova's ribbon cables?

I've got a Nova bus adaptor here, and it looks at least possilble to add a set of pins on the top for a CT2. But with the ribbon cables crossing in the middle of the longer of the two connectors, one would have to bend those cables to the other side. Then, those cables would leave the adaptor on the front side, but in a tower case this shouldn't matter.
Well, on the other hand, perhaps these cables would interfere with the CT2's connection to its clockpatch module.

The minimum clearance between nova adaptor and CT2 would be 20mm or rather 25mm without modifications to the ribbon cable connectors.

Hi Steve!

Midimaze uses the Midi ports for networking, not for plugging into a
midi keyboard or what have you to make the in game sounds.

The original post said something like this "my monitor has no speaker
so where do I get the audio from for playing games. Can I use the
Midi ports?"

Just a quick question, am I right in thinking that there is no way to transfer files from an Atari ST for and Amiga (via disk) other than using CrossDOS on the Amiga??

What I really need is an Atari ST based solution (write to Amiga disks??)

Cheers.

Matt.

However, there's a big difference between being able to turn Javascript off and not having it at all. There are a ton of websites that demand Javascript, and completely deny access without it. If we had it, then at least we could turn it off when we don't want it, and turn it on when we absolutely need it. As it is now, we're stuck without any options (other than Adamas... which doesn't work well enough to be considered an option). The same goes for SSL, unless you are one of the select few who have the techie experience enough to install Mint and Mintnet. I would personally prefer to have a Javascript-compatible (to whatever extent necessary) than Java. At this point, I can do what I need without Java, but not without Javascript and SSL. If the Milan is to sell in the common, everyday users' market, we need to have all the necessities covered, and Javascript is daily becoming more and more of a necessity. Java's not.

>Or they could put Java into the Milan III, just to ensure
>the Milan II is available Real Soon Now in the US.

Huh? How would putting Java in the next, non-existent machine make the current machine available in the US?

Hi Ed,
I'm not sure what "interpreter " means here! If it has to do with
programming and not language translation (ex. German to English), would
the source code be needed? If so, from what I understand he's not
releasing the code (for Atari CAB)! See my E-mail to you on this.

> null-modem with both 9 and 24 pins at each
> end.

That'll be 25 pin, but yes it should work okay,
you could connect ST to PC too. If one end is 9 pin you may need a 9-25 way
adaptor for one of the STs.

SC> 2. Is there any way to use one of my PCs to
> act as a "server"(connected to the 'net),

> the "client" to allow it to email, usenet
> and/or browse the web (even with no
> graphics)?

Sounds feasable, you would need to be running
some kind of proxy or router on the PC, and the ST software would need
configuring accordingly hopefully someone in here will be able to help you with
the details.

SC> I am just excited to get another ST.

And rightly so! <grin>

Regarding this issue of HDD Floppy disc drives for use on the Atari as DD drive replacement,
we have done this many times now and have not had a flop yet.

There can be a number of variations, even to no ID selects, not even surface mount ones. But
this problem can be overcome by changing the right wires on the cable.

Then you have to make sure you short out the media detect switch, otherwise you are almost certain to get the dreaded media change problem, and of course, the last thing is that the plug has to be put in upside down.

Works every time, in fact the last four that we have converted have had no ID selects at all.

I forget just now what wires have to be changed on the cable, but if you are desparate I am sure Mario Becroft has the tech info. mb@gem.win.co.nz

Exactly what I was thinking... Applause... If there's a future for Atari
clones it is with audio/midi apps, not dtp or browsers.
Imagine this: midi and HDrecording on a 060 machine. Done well it could
compete with all the blackbox HD recorder stuff from Yamaha, Roland,
Fostex whatever.
Unfortunately the German developers seem to be completly unaware what
made Atari big. Sigh.

Guido

Maybe this will cheer you up Guido, just read a message from a German Milan dealer :

"AXRO investiert einiges in die Entwicklung neuer Musiksoftware.....5
stellige Summen......"

Uns Hi¿½ndlern ist der September schon als eher spi¿½ter Liefertermin genannt
worden.....

Which means :

"Axro is investing something in new musicsoftware, sums with 5 figures.....

And : the dealers were told the Milan II will be supplied earlier than
september"

The Milan II will have midi ports on board and a wonderfull DSP card for it is ready, also
a
French dealer has announced to sell Milan II in 19 inch racks.
This sounds promising doesn't it ?

Cheers,
Dan
Milan 040 - Magic Milan

7189. NAS2000 in Gothenburg.SE has opened

Newsgroup: comp.sys.atari.st
Date: 2000-06-17 00:00:00 UTC

NAS2000 or as I prefer to call it: Nordic Atari Show 19100 has opend
with the first short 1700-2000 friday night session. Tomorrow
(Saturday) the open hours are 1000-2100.

Quite a few visitors were already here tonight and we hope to see even
more people tomorrow. Nick Marlow (That's not his name, I know!), the
16/32 guy, is here with lots of software (four big tables) on display.
Among the more wellknown Atari entusiasts were seen Erik Hï¿½ll (MyMail),
Ronald Andersson (STinG), Mille Babic (I'm afraid he's just a html
hacker :-)) and possibly some more. I'm afraid I sat down all the time
chatting with the French (or Canadian?) Pascar Poglio about my latest
efforts in programming for the Portfolio versus Win-CE
(Interpreted Shellsort runs more than two times faster on the PoFo
compared to 60Mhz Win-CE, strange...), so I really did not have the
time to check who all the visitors were... Anyway, the cafeteria _was_
well equipped with stuff to eat and drink...

To those of you who plan to show up tommorow (or Sunday!), please take
a look at http://www.sak.nu/ for maps to help you get here. The easiest
path is actually by boat (named ï¿½lvsnabben) from "Lilla Bommen". It
takes you right to NAS2000 (appr. 200 meters from the entrance). By
tram or bus it's slightly trickier (Norwegen joke!). Also lots of free
parking space if you happen to come by car.

> Sorry, but my experiences are different...

And somewhat wrong, because you can't make that big dictionaries on your
own that make sense.

You drive your car in first gear with 70 km/h and wonder about the
amounts
of fuel, the noise and the slow acceleration ;-)

We have to compile bigger dictionaries; to have them in ASCII or
accumulated
with the Papyrus-built in algorithm will make this very slow.

> Because the Dutch dictionary that is supplied with Papyrus is not really

No wonder. We can compile this for you, but because of the Wintertree
rights we are not allowed to give away this tool to make that, sorry.

> and speedy while it isn't.

It IS. You do the wrong things with the stuff, working in a manor that
it is
never meant to work so.

> I also don't really understand why ROM decided to replace the hyp file with
> that help.pap document.

Because ST Guide is dead, there will be no further development and it
does
not make everything people want on the coming up Milan.

So Axro pleased us to do something, and we will.

And there are much more possibilities, using a Papyrus file as a help
file, much more DTP, much more hyperlinking (HyperOFFICE jumps into a

database, for example).

> I also have the
> impression that a lot of topics aren't covered by the doc, while these
> topics were covered in the hyp file of version 7.5

You are wrong, totally. The new help is based on the older one. And it
is
as complete as a help could be, together with overview chapters and so
on.

OK, we will do so.
>
> Btw, one important thing would be to use ST-GUIDE files for Help,

No way. ST Guide, sad to tell, is a dead format, not being developed
further.
We can improve the Papyrus help (and we already did), but it will be the
way for the future, Axro already pleased us to support a free version
Papyrus VIEW for being accessable for online helps also for other
applications, and we will.

To make the stuff more fast, you have to load the "pap_help.pap" and to
save it with a font you have installed.
And do so with the new help since 8.20 or the coming up 8.21, because we
no avoid that also graphic filters have to be loaded when loading the
help file.
Also we can do some profiling to speed this up, if still neccessary
after all.

Yes, please!

On-line help can work in some cases but there's no substitute for a printed manual that you can have open in front of you as you work and experiment, and can quickly flick to another page for reference.

Esepcially as ST-Guide is no longer being used, which was fast because it used system fonts. Now that Papyrus help is a Papyrus document it can take a very long time to load.

I've tried on more than one occasion to learn how to use various features of Papyrus Office (e.g. database, and maybe more basic things such as loading printer drivers) but have given up in frustration because it's too slow to navigate through the on-line help. Also, on some dialogs, there is a Help button but when presesed it says there is no Help for that item. At least with a printed manual you can browse quickly through to see if there is anything relating to it at all.

Hi Ulli

>Does anybody think there is need of a printed manual, after having read the helpfile
>given with the software (pap_help.pap)?

That would make it a more 'finished' package, but then theres the problem of ongoing development, would you then add any new features to the manual or add a suplement, that would make things very sloppy very fast, also you run the risk of having a stockpile of outdated manuals if you enhance the program too quickly, along with the attendant cost, unless you print them to order. Then there's the cost of transporting them, who would pay this cost?, who would want to?

I believe a manual would be a very good idea, but at a point in the development when the manual stands a chance of reflecting the program, and at a price that would make the program accessable to the users.

With all these new versions coming at us so fast its getting difficult to decide at what point to purchase the package, bearing in mind its an expensive download for some.
Is it possible that you could supply diffy/patchy files for existing users to upgrade with, otherwise telephone costs could seriously stunt the growth of this product.

Thats my opinion.

I'd be interested to know that also. I've always understood those files
are a custom/proprietary compression scheme used for all the files on
program disks and CD's in the Microsoft world.

A suggestion, perhaps Wintertree could be approached with the idea of
selling the tool for as an option with additional fees, or selling
direct to users who need large custom dictionaries.

I didn't find the download too much - with a 56K modem, I can't
remember exactly how long it took but it was about 10-15 minutes.
That's 15p at the most!

I agree 500% on Chris's comments. But substitute any other program you
can name for Papyrus Office as I've not ordered my copy yet. I really
hate the lack of manuals and quick reference cards that were so common
with Atari 8 bit programs.

Steve Sweet wrote:
>
> That would make it a more 'finished' package, but then theres the problem of ongoing

> of outdated manuals if you enhance the program too quickly, along with the
> attendant cost, unless you print them to order.

You can control this problem to some extent by the way you organize and
number the pages, and then create the manual. Here's my suggestion:

Look at most manuals. If there are 150 pages, they are numbered
1,2,3,4,5,6, etc. So if you make a change to page 5 that now overflows
to the next page, everything is now wrong when it comes to page numbers

for the remainder of the manual, almost 145 pages. One answer is what I call chapter numbering. Let's say there are 10 chapters in that 150 page manual. Number the pages of the first chapter 1-1, 1-2, 1-3, 1-4, etc. Then number the pages of the second chapter 2-1, 2-1, 2-3, 2-4, etc. Do the entire manual this way. Then, when you need to update, only the appropriate pages, new index, and new table of contents need to be supplied. The manual binding would have to allow for the changing of pages, which means some type of ring binder. And if you used commonly available paper sizes for which binders are easily purchased, only the paper part of the manual needs to be supplied. The user can purchase the ring binder of his choice, in his favorite color! <G>

But there is still the printing and shipping cost. Solution, make the manual a Papyrus document, and let the user print all of the manual or only the parts of the manual he need. Better yet, make Papyrus capable of doing automatic chapter numbering of the style described above. Also give Papyrus the ability to automatically generate the indexes and tables of contents using the chapter numbering system. Then the user could print the manual in whatever page size desired. I think that would avoid the problems of US vs. European paper sizes. The manual could be distributed with the program. And updates to the manual could be placed on your web site for downloading.

The program distribution files would be larger. I would suggest that it not be emailed. Some servers have limits on the sizes of files that can be sent as an email attachment. I've run into this problem a few times. Change Papyrus so a "key" is needed to activate all the program's features. Now you could make the demo program on your web site the complete program, except you retain the limitations unless you have a "key". Then, just email the key to the purchaser. Program updates could be handled the same way.

Just some thoughts.

Hi!

I got this old marpet RAM upgrade board for an STFM. The STFM only had 512k and the marpet board had two 256k simms on the board in the two slots nearest the ribbon connectors to make 1mb of RAM.

Can I put 4 1mb simms in to get 4 mb, won't there be a problem with the 512k RAM on the mother board being in parallel with some on the marpet boards RAM.

I've got no manual for this board.

Please remember that the chapelie is used by the students too. Right now
it's the last month of school so I can imagine that lots of students are
using the Chapelie Network to prepare their examins. This can be a reason
why the chapelie is so slow sometimes. Even I (I'm using a ftp-connection
like you all) do have severe problems to upload stuff during the week. If
possible I postpone the uploads to the friday night (local time)
Best time to access the server is during the weekends.

>But then I wait for half an hour and ... back to normal 4,5 kb/s

>Or am i fantasising now?

I can't say a decent word about this. The problem is that Karl Samyn, the
one who know the ins en outs of the server, hasn't an Internet connection
for the moment. I'll try to contact him.

You mean Pascal Poglio I suppose. AFAIK he's living in southern French.
It's a very nice chap. I have had the opportunity to talk to him a few
times (the first time was at the NAS 99).

I have a Notator SL manual to sell. This is available for a Notator user
with a lost or damaged manual. price is UK pounds 20,00 plus postage from
South Africa.
The reason I have the manual is that I upgraded to Logic and handed in the
SL dongle when I sold my ST and bought a Falcon.

7209. End of SHAG?

Newsgroup: comp.sys.atari.st
Date: 2000-06-18 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <8ijaj5roc1@plutonium.compulink.co.uk>
Source record: 60715

Hi!

It looks like the South Herts Atari Club (SHAG) of Stevenage, UK is no more. Last Wednesday's only 5 members turned up again, and the organiser told us that the income generated was insufficient to carry on.

I suppose it's possible that someone else will try to revive it, but otherwise it seems we must say 'goodbye' to another Atari group.

Ex-members will be welcome at Cheshunt Computer Club, meeting normally on the 3rd Wednesday of each month at the Garden Room, Wolsey Hall, Windmill Lane, Cheshunt, Herts. Details from Derryck Croker - email derryck@cix.co.uk

Regards, /Peter/

Just to redress the balance, I thought I'd mention an example of an
on-line manual that DOES work!

As much as I hate to say this, MS Help works quite well in
applications like Access. I frequently find myself lacking the syntax
of a particular command or function, and it's a piece of cake to bring
up the Help (minus the paperclip of course), type in the function
name, and up pops a complete syntax explanation.

It doesn't work when you want to find out *how* to do something or
why you should do something. I very often find that the online help
simply directs you to the menu option (e.g. "move the mouse pointer to
the Options menu, highlight the Settings option and left-click once"),
as opposed to explaining the facility you're looking for.

Yep, that's the problem with online help. It assumes you know how to do something, and that you are simply forgetting how or making a simple typo type error. But if you don't know how, or don't know the syntax, you're more or less out of luck.

Ever tried to "thumb" through online help trying to find a graphic that looks like what you want to do? Or, Heaven forbid, have help windows for different things all open at the same time??????? :-/

Hi Ric,

RE>I have spent two happy years online with my 1040STE (4MB) until
RE>recently when my service provider changed their modems over to some
RE>digital type.
if they really changed over to digital equipment, e.g. to something like ISDN (as we in Europe or at least in Germany call it), you may have to switch over too to a digital converter (modem means A/D and D/A) or some 'hybrid' stuff (ISDN converter and modem in the same box).

I'm running an (analog) 56k modem (Elsa Microlink pro) without any problem connected to my TT's Serial2 port with 230.400 bits per second.

But due to the hybrid 'modem' of my favourite BBS, I achieve connects wit honly 28k8. An ISDN connection would do the job with 64.000 bits per second or (two channels bundled) with 128.000.

Sorry, if I missed your problem.

Hi All,
Being the owner of a website, Javascript would come in very handy
in order to take advantage of some ISP's or Host's on-line site building
tools which require Javascript to use. All (so far) force me to hire

a third party to design and upload the website and any subsequent changes or additions to it. There are some nice website building programs for Atari which are in the process of being expanded but the Hosts may only accept input from their own design programs (although there are FTP ways to do some of the tasks). I could be saving bucks and the time describeing what I need done (not to mention the cost of a PC and a bigger hard drive to save all it's redundant files) if there were an Atari based browser with Javascript that allows me to do it myself and maybe at 3am when my designer is out cold! Oh yea! On the lighter side, there's chat!!!
Maybe Highwire will save the day (someday)!
John G.

Adding new features increases the development time.
I don't believe the Milan II has Java in it, and
adding it at this late date would just delay it's
availability.

7223. V90 Modem Driver?

Newsgroup: comp.sys.atari.st
Date: 2000-06-18 00:00:00 UTC
From: Ric Easton <biodistributors@microtech.com.au>
Message-ID: <394CA61D.31CBD1@microtech.com.au>
Source record: 60793

I have spent two happy years online with my 1040STE (4MB) until recently when my service provider changed their modems over to some digital type. I can no longer connect to them even though they say nothing should have changed in the way of settings etc my end. They did say i needed a V90 compatible modem 56K. I have tried one of these but still no connection. I suspect it may be the HSMODA06 driver I have for the modem does not drive a V90 compatible modem.

Has anyone had a similar experience or have any ideas? Are there any other modem drivers other than HSMODA06?

I would appreciate any help as it is driving me crazy having to use our (new) PC for email and newsgroups etc. Pop watch is just so good at viewing mail and cutting out the crap and long unwanted ones before downloading and I never had any problem connecting with STinG.

Thanks

Ric Easton

Hi Andy

A lot of drives don't have the jumpers on the back, but almost all of them have little solder pads on the PCB somewhere near the 34 pin connector.

Look near pin 10 and 12 and you might see some pads with letters like DS0 and DS1. Most PC drives are set to DS1, just remove the solder there and place some on the DS0 pad.

Also a clue is if you have a metal cover that covers the bottom of the drive, protecting the PCB, you might see some holes and these are usually holes through to the PCB where the pads are. Just look through them and you'll see what I mean.

Yep, I've done that. It takes 11 seconds to come up initially, and 3
seconds if you keep it in memory (on an un-accelerated Falcon). But
if you keep it in memory,
there's less space for documents. I loaded the Tutorial document, and
with the help file loaded there was 5MB left (on a 14MB Falcon).
After scrolling through the document and loading all the images, there
was 500K left!

>> Also, on
>> some dialogs, there is a Help button but when presesed it says there

Two at random are the Options/Memory dialog and Options/Compatibility
- examples where help is very much needed!

>> At least with a printed manual you can
>> browse quickly through to see if there is anything relating to it at
>> all.
>
>So you can with the loaded help ...

I disagree - it's so easy to flick through pages in a printed manual.
I stand by the argument that on-line help is fine for *reference*, but
when you're trying to learn about something, maybe following examples,
a printed manual is best.

Scrolling through that help file from top to bottom is very slow to
find if there is anything of interest. It's easy to lose your

position, whereas with a printed manual you can skip backwards and forwards between index, contents, relevant pages etc., keeping your thumb in the index maybe. Literally flicking through the pages to see if there's a chapter title that catches your eye.

It's one of those situations where a computerised solution is not the best way - like keeping a computerised list of what's in your fridge!

I'd willingly pay a bit extra for a decent manual (liek the one I've got for Papyrus Gold), however I do understand the logistical and cost implications for the software producer. I'm just stating my view!

Either a Help file that loads _FAST_ (like ST-Guide) or a printed
file. Having the help file as a PAP file is a bad mistake.

> >It has a MIDI IN/OUT ports, but I do not believe you would use those
> >ports for sound in a game.
Ok, ok, ok! ;) After further consideration, I have decided to change my original assumption. As of this moment, I believe that more than a few games, but less than a lot, use the MIDI ports as a way to produce sound for their games. I repent... for the love of everthing that is pure and decent in this work-a-day world... I repent...

> All Atari ST monitors came with speakers built in, right guys?
> Andy Blakely
It's an Atari SC1224 color monitor, and after playing around with my ST this weekend, I have discovered that it does in fact have a speaker at the back, and it is operational. The only problem being, of course, that no game I own seems to take advantage of it. I have found a company that provides a solution to my problem in an elegant fashion with a device that produces stereo sound instead of mono for the ST. I'll let you know if it works or not, when I receive it.

On a related topic, what do I need to hear sounds from games that use the MIDI port? Lyndon Amsdon mentioned something about an external sound box?

Michael

7230. Atari-friendly / made MP3s available

Newsgroup: comp.sys.atari.st
Date: 2000-06-19 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8ilqro03vm@enews1.newsguy.com>
Source record: 60650

Just a note to let you know that I've got several "Atari-friendly" MP3 files up on MP3.COM.

All the songs were originally recorded and sequenced on my Falcon (with CAF), and then I created AIFs and WAV files (which unfortunately, had to be ported to an available PC to make the actual MP3 file). Anyway, it's "electronic" music, and if you'd like to hear some of them, please visit:

http://www.mp3.com/nurvis
(this is the band "NURVIS" which is myself and a female vocalist)

http://www.mp3.com/varactor
(this is my solo project called "Varactor Ratio". There are only a couple songs up at present, but many more will be put p later this week.)

* Atari/CAB users note:

If you use CAB, everything will still work. When you get to the page, make sure you click the "download" link, __not__ the "lo fi" or "hi fi" links, as these are designed to stream the audio to you using something like Real Player on a PC/MAC.

If you've never visited MP3.COM before, they might ask for your e-mail address. A neat trick to avoid this with CAB is to simply RIGHT CLICK the song's "download" link, and CAB will sort of bypass the e-mail question. :^)

Anyway, thanks for reading!

And if interested, there is more information on my site:

http://www.nurmix.com

My web site [Nurmix Web Central] now has it's own domain name.
(And in case you haven't visited Nurmix Web Central yet, it has a lot of
Atari computer information).

The __old__ URL (which is still useable for now), is:

http://www.tsotech.com/nurmix/home.htm

The __new__ and improved URL is:

http://www.nurmix.com

And I will be adding some classic ST games and demos to the download section
later this week as well. Check it out. And there's also information on my
Falcon-based MIDI studio, and my electronic music projects, "NURVIS" and
"Varactor Ratio".

Turn the machine on without a game disk in so you get to the desktop.
You should hear an anoying ping noise everytime you press a key
(unless you've turned it off with a CPX etc). All games use the
audio from the monitor port.

>I have found a company that provides a
>solution to my problem in an elegant fashion with a device that produces

Hows this work? The ST doesn't have a DMA stereo chip like STE, does it
add one to an ST? Older games don't use the DMA for sounds which means
older games are mono. Fake stereo?

>On a related topic, what do I need to hear sounds from games that use the
>MIDI port? Lyndon Amsdon mentioned something about an external sound box?

I say a sound box but all you need is a midi device (bad wording on my
behalf). Keyboards are more commonly seen with midi on the back than
ever (cheaper too). Don't bother using midi for games, not many games
use it for audio (although quite a few use it for networking -
Substation).

I've decided to print the manual - will take a long time but there you
go!

As you say, it's probably just a case of learning initially, then you
can make do with on-line help afterwards.

Not me. Until I actually used the help file, the need for a printed is
useless. Usually help files are small, but this one is large to suite my
needs. Besides, if the help file does not have the subject I need, I can
always get help from ROM.

The trick is to force the TT to boot-up in ST-Low not TT-Low.

Put the disk into the TT.
Turn on the machine hit the space bar before drive light comes on.
This should do it or use a game with an autoboot that force the TT
into ST-Low with a splash screen that pauses before booting from the
Auto folder and swap it out for SunDog.

Raymond

The game just simply locks up when the disk is loading before displaying the swooosh. I am sure the disk is good as it works on my 1040.

WRAG Could go the same way as well:-((((

I had to give up on it myself as I can no longer get to the meetings, so I
handed the running of the group over to
Adrian Haigh-Hutchinson
E-mail Address(es):
Director@blackflag.zetnet.co.uk

But sadly from whjat I've been told there was only a couple of people turn
up at the last couple of meetings:-((((

If it wasn't for other commitment on a weekend I would still be going along,
but weekends are no longer my own.

The on board ram needs to be banked out. There is a row of resistors near the ran sockets on the mainboard, (data lines I think). These need to be removed. If any one has a manual for Xtra ram they should be able to help you out with the exact ones to pull out.

No, I think I'll stick to Rodolphe's suggestion after all, meaning that I'll
solder a male/male connector on the Eclipse and put the CT2revA on top of it.

>One other option Rodolphe mentioned was to solder my own through-port on

> port to it, the picture on Titan/Coretex/whatever's web page is way too poor
> to make this sort of detail out. How much clearance is needed for the
> connectors/ribbon cables?

Yes, it shouldn't be any problem soldering the connectors onto the Eclipse.
About 20mm clearance would suffice. One of the ribbon cables will cross one of
the soldered connectors though, but that is just a matter of bending the cable
in the opposite direction.

Regards
Henrik

Yes, there will be. The installation you already have should have one or two resistors with one end removed from the PCB and wired to the +ve end of a nearby capacitor. Do the same with the other resistor(s) in the same bank to disable the ST's 512K RAM.

I'm hazy on the exact details, but this should be enough to give you the idea.

If the modem won't connect then no amount of fiddling with versions of HSModem
will help.

Ric's got himself confused, there is *no such thing* as a modem driver on the
Atari. HSModem is a patch for the serial port, and has no effect whatsoever on
the ability of the modem to connect.

>problem connecting with a 28800 on my Atari's!!!! Or with ANY other ISP,
>I've tried, with using it on a pc!

Well I just wanted to add this litle bit of information. It's my
opinion entirely and any similarity between it and reality I will leave to
the reader.

1. Most ISP tech people don't know the difference between LCP and
IPCP. In fact unless they have read the box of some canned piece of
software, they probably don't even know the words. (I've heard europe is
better than the US, so please keep that in mind as well)

2. Most experts on TCP/IP in the US are really only experts on
Microsofts software installation and setup. I've had a few rounds with a
tech of somewhat national standing who makes 3 times what I do in a
year. And they inevetiably fall apart quickly with him not understanding
basic bits of what he is supposedly a national level expert on.

3. Most PPP/SLIP is done through hardware solutions these days. You would think this would help the ISP get their act together. In truth I think it just means they felt justified to fire the few people around that did know what they were talking about (I am not now and never have been employed by an ISP)

4. The level of incompetence has reached the critical failing point that they can't help an average user with a real problem with their service. They frankly can't help as they've never been taught anything about the subject. If it's beyond setting up DialUp Networking in windows, it's beyond their education.

5. Learn some buzzwords and what they mean. Like TTL is time to live. It is entertaining if nothing else. And will ensure when you arguing with your ISP that at least one of you has some idea of the subject. I have caught local ISP's throwing out buzzwords to try and amaze me with their knowledge. It might have worked if I didn't know what the words meant and realized that they obviously didn't.

6. Finally the solution. Look for another ISP. They are quite possibly using a misconfigured ASCEND router and your chance of getting them to fix it is litle to nothing. I offered to fix a local one for free after showing them that their national consultant who charges them $1000 hour didn't know his anus from his mouth. Needless to say my lack of Microsoft Certification makes them worried. Idiots.

Hi all,

I'm in the process of researching a book about the "golden" home computer years (1980-1990, roughly), with a focus on the european scene, and I would very much appreciate any assistance I could get on the following:

- The companies and people behind the machines: company histories, financial data, developer bios, and, dare I hope, contact addresses of people involved in the development of any of the popular home computers

- Magazines, reviews, product catalogues and promo material (for scanning or photographing)

I'd also be very interested in infos about machines that were limited to a certain market (Thomson TO/MO series, etc...) and all those machines that didn't quite make it (like the Enterprise 64/128, etc...)

Also, if anyone is/was involved in demos and user groups, I'd be more than glad to hear from you.

Thanks a million in advance, and apologies for the cross-posting
Robert

Thanks guys,

I'll look at the schematics for the STFM. I thought it would be
something like that. It's most likely to be the RAS and CAS signals
that need removing.

I'll experiment though.

Thanks again.

Chris Simon wrote:

> Now that Papyrus help is a Papyrus document it
> can take a very long time to load.

No, itï¿½s only a configuration problem. Again - the difficulty with that
is that there is no standard font on the Atari.

You have to directly load the "pap_help.pap" out of the "Help" folder,
to replace the font(s) not there against those you have and it will be
much faster, not more than a few seconds (1 - 5) loaded the first time
and less than one second afterwards.

If there are still speed probs, we could have a look with a profiler to
speed it up.

Also you can print out that chapters you are mostly interested in.

> Also, on
> some dialogs, there is a Help button but when presesed it says there
> is no Help for that item.

Which one? This is a bug (maybe an online help bug, so mine, I forgot to
write a chapter), then.
But I tested and thought to have chapters for every dialog ...

> At least with a printed manual you can

Another problem is how to get the manual to the user.

Sending post packages all over the world is expensive. So why not making
a real
good online help; printable (!), because created as a text document, as
well - if there are any problems with that concept, we are wide open to
solve this.

Hm ... Don't think so, because there is no real difference between that
and giving away the Wintertree compiler ;-).

But test us - send us whatever ASCII word list you want to have
compiled, we will do. And if we are allowed to add those wordlists to
ours, the dictionary will get better and better, for all ...

The bad thing about computing, always. :-)

Changes normally are minor, but we do have a constantly growing program,
so why hiding
this from "you", from the customers?

Around 4.5 MB mean a download rate of less than 5 minutes, normally ...
Once a month,
where is the problem?
Even if we would do an update once a week? (What we won't)

> Is it possible that you could supply diffy/patchy files for existing users to
> upgrade with,

No, sorry. We already have to care for 18 (!) versions - Atari, OS/2,
WIN, OFFICE,
WORD, Demo, English, German, other OS and languages about to come, and
we do have
a bulk of new customers for each new release, as well, getting the same
files.

And, again, 4.5 MB is SMALL.

> otherwise telephone costs could seriously stunt the growth of this
> product.

Ah, not really ... Where do you live, that you do have that expensive
telephone
costs? ;-)

I canï¿½t see the problem, instead of one - reading a manual in bed /
bath.

Everything else is cared for in our manual. It is not only an online
help,
it is more, it is a complete manual, with introductions, overview
chapters,
quick references ...
And if something's missing, just tell me ...

Even manuals can lack things ...

Hi Ulli,

I have printed out your help file and it makes a great manual, excepting for pretty pictures. As a single user licence would go with the purchase of Papyrus, would there be anything wrong in you supplying a screen dumper, it would have to be a little special, eg able to show drop-down menus and other RSC objects, but pasting the prints of these into the large spaces so conveniently left at the bottom of most of the 'Manual' pages, would improve it 100%.

Just a suggestion.

Bye

Aehm, sorry, but is it possible that you didn't have had a look at
the Papyrus online manual?

We put in MUCH work and MUCH love to do it foolproof and care for
the point that somebody is not sophisticated with the text of a
checkbox or whatever.

I even HATE online helps that do the following:

You find a dialog with a checkbox that tells you

"Ebosinate the grublin with merkinols". You think "What? Which? Where?",
and the online help says simply

"Here you can ebosinate the grublin with or without merkinols".

Thatï¿½s what we AVOID in the Papyrus online manual. Printed or online.
We always tried to find different words and additional explanations.

And if you are unlucky with the complete dialog, mostly you will find
overview chapters for the main functionality parts.

AND there are overview tables for all syntax and keyboard shortcuts.

Ken Springer wrote:

Do you can open a book at several pages? ;-)

For some reasons, I also love printed manuals, but in this case the
English version is spread all over the world, and we have to get it
to our customers, somehow.
A printed manual would have stopped us for another quarter of a year,
I guess.

I think an online manual, designed for being printable, as well, is a very good compromise, then.

OK, maybe I should make one derivate of the manual, maybe for download,
on our homepage, filled up with screenshots, all menus and important
dialogs
and so on.
For Atari users this would slow down the story, and would take more
memory ...

Hi Ulli,

thanks for your prompt response. What I was getting at was not more work for you, you have done more than enough, but putting into the hands of the legit user/owner the selection and making of his own 'customised' manual, based on your text (help.pap file) and his/her/its chosen screen dumps. I appreciate that the online help format is in the name of economy and that yes of course you could provide a manual, but at a cost and a cost that would put Papyrus beyond the pocket of most. On a smaller scale, Aniplayer and MyMail have HTML manuals so your idea is possible. I think that for the amount of work you would have to put into it, you would be silly to make it non-password protected otherwise the pirates would have a field day!!!

Bob King.

Pirates! was a game that put out sound to the Midi ports. I believe there's a few others, too... if you haven't played Pirates! you should try it... it's still one of the funnest games! And the music is really good!

To answer your main question, you might want to take the monitor case off and see if the speaker wire got disconnected somehow. If I remember correctly you won't be able to remove the case completely because the speaker is mounted on the side of the case and the wire hooks onto the guts. Maybe a previous owner yanked it off! All Atari ST monitors came with speakers built in, right guys?

I don't know where Steve lives, but there are lots of places in North America where connecting with the internet means long distance telephone charges. At one time, my bill was always around $200 US for accessing the net.

It's not our fault, again, that there is no standard font in the Atari
systems.
Do the "tricks" (use 8.20 version, exchange fonts and save the important
docs pap_help.pap, tutorial.pap, _new.pap, fill and save your speedo
cache), and it will be fast enough, I guess.
We also will have a look with a profiler, if not, to have a look, if
we can speed it up, also.

My apologies, Ulli, my comments about online help were intended to be general, not Papyrus specific. I was not at all clear about this.

And yes, I do have a book open at several pages at the same time, by having as many fingers as possible stuck between the pages. <VBG>

I've sent you email about a file I sent you a couple of weeks ago.

Thanks.

Hi,
This behaviour is normal :(
The SCSI-bus on the Falcon isn't fast enough for 4X-burning, so the only way to burn at 4X would be to move the files to a fast EIDE-drive instead. I got this explanation from SoundPool about a year ago or so.

I think that that's a wise move :-)

What sort of connector will you use? You'll obviously need some sort of jig to
keep them aligned whilst you solder. Blobs of Plasticene?

Please let us know how you get on! :-)

Once again.

In some countries even local calls are charged for. With the complicated way
that calls are charged for, just a second's more online time can push the cost
of the call up.

This isn't a dig at anyone, but it's a very sore point.

Hello,

in article <394F8893.622669FA@rom-logicware.com> (comp.sys.atari.st)
Ulli Ramps wrote on Tue 20-06-2000 17:06 (+0200):

> No! I'm a book freak, really; I do love books. But the Hypertext - and
> HyperOFFICE - possibilities open a totally new world for tutorials and
> manuals.

There is (are ?) pros and cons for hypertext docs. I often prefer a
printed manual but I also like online help. They are complementary and
not to be hmmm... set against each other.

Someone (Martin-Eric maybe) would have prefered a ST-Guide one. I was
very happy with the one supplied with Papyrus 7.xx (except that the file
was not good, local problem, private "joke"). Problem is not that
ST-Guide is no longer supported (for the moment) but that it's difficult
to print a whole HYP file.

Another way would be html but the problem is the same for printing than
with ST-Guide.

The hypertext format of Papyrus is very powerfull and allow printing. I
think it's a very good way, especialy when it's possible to upgrade via
the Net. I do not have a very fast link with my phone line at the moment
(analog line, 33600 bps as V90 is not reliable at all) but... I have
plenty of RAM :-).

Just my two cents.

Bye,
/Pascal/

You can make upgrade the serial port yourself for less than ï¿½10 GBP's.
mine took me about 30 mins. including taking the case and shielding off
etc..

This should allow an ST to go to 33,600bps. Even with the RSV board,
you'll need an excelerated ST to get v90 speeds!

Hehe. If we are that concerned about byte counts, then maybe some people should consider trimming down their e-mail signatures, choosing not to include part or all of the original message in their replies, and stop posting useless, uninformative messages like this one. ;)

That tweety board sounds useless. It's not real stereo just two mono
channels. That would be piss easy to make, they could have at least
made a spatial(?) unit to make it sound stereo even if it wasn't. If
you want good sound buy a cheap second hand STE. Protracker still
amazes me. 50khz sound quality!

Kings Quest IV does but none of the earlier ones do. Problem is it
isn't GM comapible so all the sounds are wrong, it was designed for a
Roland MT-32.

Hi!

Not owning a Falcon I wouldn't know but my best bet is the SCSI
interface can't cope with the speed of data transfer. I think adding
an accelerator, even as cheap as the Nemesis can help quite a lot.
Speeds up the transfer rate on the SCSI bus.

It may not be in stereo. It may not be a technological feat. But it IS
cheap to buy. I think it lists for less than $5 (US).

There are loads of programs which will report available RAM. If you don't
have any then look for FREERAM.ACC in the public domain.

Otherwise the only way to tell is to remove the cover and suss out what
engineering work has been done but this will require more time than running
the above ACC.

Best to use a fast EIDE drive as the source. I burn CDs
straight from a (sometimes fragmented) hard disk (no image
file) and never had a failure. Besides that, SoundPool
software all works best with IDE, not SCSI (apart from
the CD writer itself, obviously).

Also bear in mind that audio writing typically requires
more host CPU power than raw data. You may find that you
can achieve 4x for data. Beyond 6x speed (using Anodyne's
CD recording software and a special patch), you're limited
by the slow speed of the Falcon SCSI.

Hello,

I almost never use the news groups anymore, however i was trying to find
some information about a subject i was intrested in and for the heack
of it decided to do a find on Atari.

It is because of the Atari computers that i am in the field I am today, and
well I want to give a little something back. So I am willing to give
up free web space to any Atari related pages on one of the fastest
networks in the US.

If anyone is intrested in this please mail me

Atari@city-guide.com

P.S. I was one of those little brats that went to Atari Summercamp
back in the day...

7295. I-Connect

Perhaps someone could help?

When I log-on using I-Connect everything seems to work ok. The modem
display indicates that I've logged on (to Demon) as do the various
noises from the modem :-).
The task bar gets to the end of the sequnce and the program then freezes.

The following messages are displayed
Status Get IP addresses
Command Service-Eintrage (there's an umlaut over the last a)

Anybody any ideas what they mean?

Thanks

Mike Bedford

>anywhere on the web. How can I run Fast Basic programs?

I havn't tried this with an emulator, but you may try:

1. Get the floppy-version of FastBasic. I don't know where to find it.

2. If you only want to run programs, get the runtime program. I have it
here and can mail it to you if you want. It might also be possible
to find on ftp sites?

3. I do have the cartridge based version and can convert the files to
ASCII for you. This would make it possible to port the programs to
some PC basic language? Depends a lot on how the programs were
written off course.

>you'll need an excelerated ST to get v90 speeds!

Yep mine is running at 38,000 bps. This mod was one chip a 74LS74
that was salvaged out of a dead Commodore 64. Works fine except you
need a switch to switch back to 19.2k speeds or lower.

In the System Solutions catalogue (spring 1994) it clearly says "RSVE
is a small hardware add-on to enhance the STs serial-port to 38400 and
57600Bd with HSMODEM patch" whereas the documentation of the RSVE
says it's not possible to get 56k unless the CPU is running at 16mhz
or more.

So who's right?

Well seeing as $5 is nothing then yeah thats fine, it probably adds
some phono outputs like the STE. If it doesn't I would recommend
adding some.

That almost goes without saying...

>Well seeing as $5 is nothing then yeah thats fine, it probably adds
>some phono outputs like the STE.

They should really be called RCA sockets. Phono defines a signal
level, very low (typically from turntables), much lower than
line level.

>If it doesn't I would recommend
>adding some.

Yes, it makes connection to proper amplifiers easy. You haven't
lived until you've heard the Atari key-click at 70W RMS per
channel with active sub-woofer...

I had one and used it. It did a fair job, I ended up taking it out. It
seems the way it is attached (sticky pad) screwed some internal connections
inside my ST. Took me awhile to clean it up.

Don't get the modem speed mixed up with the port speed. When 28.8 modems
came out, articles on the TT serial port were calling for 115,200 speeds
on the serial port to support 28.8 modems, though PC's usually set it at
57,600 to support 28.8, and 115,200 to support 56K.

>gives you a 14400bps connection to the ISP, whatevet the modem, and whatever
>the driver.

Surely not!

The modems will connect at the fastest mutual speed available, no matter what the serial port is set to! You won't get the fast _transfer_ speed that a V90 modem could supply without a much faster port - I think that's where you've got confused. A 14400 baud modem is often recommended for use with the ST, as that provides about the fastest rate commensurate with the 19200 of the serial port, at a reasonable price.

>You can:
>-upgrade your serial port with an RSVE board. No idea where to find one of
>these nowadays, and a little tricky to make yourself.

System Solutions sell the genuine RSVE board, or there are derivitives available in the PD. Vezz's hardware hacks page would most likely be a good place to look.

I just found out a couple of days ago, quite by accident
that the Atari Jagfest 2000 is a go.
In fact, its this coming weekend, June 24th, 2000.
It is at the U.T. Student Union Building. 10Am to 11Pm. $10.00

Bring your Jaguar, with Battleship to compete, and probably a
small TV.

And bring your Lynx too!

See the site at:"http://jaguar.holyoak.com/jagfest/jf2k.html".
or my link at "http://people.delphi.com/rldetlefsen/".

Hi Bill,

AFAIK the yamaha sound chip has three audio output connections, which
can be strapped together in different pairs to make a psuedo stereo
sound. I have an article in a very early Amiga and Atari Format Magazine
that shows you how to do it. As far as I can remember it proposes
bringing out the sound from non-used printer centronics pins. If you are
interested I will look the article up somehow send.

Bob King.

> transfer files from an Atari ST for and Amiga (via disk) other than using
> CrossDOS on the Amiga??

You can also use msh1.56 (aminet) or other utils, like dos2dos or something
like that.
Because crossdos is a part of the OS, no other tools there used for this.
You can also use a serial-nullmodem cable and terminalprograms to transfer
via zmodem. For this case be shure to use artser.device or 8n1.device
because
the serial.device will not do 57600 or 115000.

> What I really need is an Atari ST based solution (write to Amiga disks??)

The problem is a hardwareproblem, who should build a special expensive
hardware for 2-3 users in the world wich don't like to use software on
Amiga-side?
On the PC there is a controllercard "catweazel" wich will also provide the
"amiga-format". (make sense for WinUAE-users)
"amiga-format" means, writing one complete track at once to the disk without
gaps.
If your controller only can handle sectors you have lost.

Hi Guys,

I'm looking for a "LINK 2" SCSI adapter to connect a SyQuest SyJet drive to
my Atari 1040ST.

Anyone have one for sale or know were I can find a used one?

Thanks,

Trenchcoat Steve

> and it is operational.

The SC1224 that I have has the speaker on the side. It actually has an
on-off/volume button on the side, so there's no doubt that there is sound.
But there were several different OEM manufacturers for Atari monitors.

You SC1224 should have sound. I would suggest that either:
-volume is low
-wire is disconnected
-your ST's sound output or chip is broken

> The only problem being, of course, that no game I
> own seems to take advantage of it.

I've never seen a game that doesn't play any sound. It's definitely one of
the above.

> I have found a company that provides a
> solution to my problem in an elegant fashion with a device that produces
> stereo sound instead of mono for the ST. I'll let you know if it works or
> not, when I receive it.

Is that a tweety board? Pretty useless if you ask me. It only separates the
3 channels of the yamaha chip to 1 left, 1 right, 1 mixed.

> On a related topic, what do I need to hear sounds from games that use the
> MIDI port? Lyndon Amsdon mentioned something about an external sound box?

Yes, you need some sort of MIDI synth. A cheap GM keyboard or a sound module
should do. Roland, Yamaha and Korg do some cheap boxes just for that.
However, there were few games that actually used this. I've only heard of
the Sierra adventure games and Pirates!.

> >>drive a V90 compatible modem.
> >>

It should have nothing to do with "digital or analog" modems. All modems are
D/A A/D modulators (MODulator/DEModulators actually), that convert binary
signals from your serial port to analog sounds that go over your phone line.

V90/56K is just a faster version of 28.8K.

Maybe they have upgraded their modems to a new type that do both V90 and
ISDN, and these things don't support anything slower that 56K? Or maybe they
just can't be bothered to configure it properly.

Anyway, in this case, the problem is not with your modem or HSModem, but
with your ST's serial port that can only handle a max of 19200bps, which
gives you a 14400bps connection to the ISP, whatevet the modem, and whatever
the driver.

You can:
-upgrade your serial port with an RSVE board. No idea where to find one of
these nowadays, and a little tricky to make yourself.
-upgrade your machine to a TT or Falcon that have faster serial ports, and
therefore allow you to actually get to 56K.
-change your ISP to someone with a more open mentality.

Another tip fpr speeding it up.

You already should have done the replacing of the most important files
to your standard font (pap_help.pap, tutorial.pap in the Help folder;
_new.pap etc. in the Template folder).

No you should load pap_help.pap and scroll through it, completely,
and then go to the "Memory" page of the Options notebook.

No you can save the Papyrus' speedo-cache (Save cache). Have a look at
the size of the filling rate of the Papyrus' cache, maybe you should
increase the size of the Speedo cache (if you have enough memory, the
size still making sense is at a maximum of 1MB ;-)).

This will speed up Papyrus a lot, when using vector fonts.

Chris Simon wrote:
>
> there's less space for documents. I loaded the Tutorial document, and

> was 500K left!

Logical, isn't it? By the way, whatfor you kill 9 MB, before? :-)

> Two at random are the Options/Memory dialog and Options/Compatibility
> - examples where help is very much needed!

Yep, OK, that both are Atari-specific, and I lost the translation
somewhere.
I will add them in version 8.21.

> I disagree - it's so easy to flick through pages in a printed manual.
> I stand by the argument that on-line help is fine for *reference*, but
> when you're trying to learn about something, maybe following examples,
> a printed manual is best.

No! I'm a book freak, really; I do love books. But the Hypertext - and
HyperOFFICE - possibilities open a totally new world for tutorials and
manuals.
>
> It's easy to lose your
> position, whereas with a printed manual you can skip backwards and
> forwards between index, contents, relevant pages etc., keeping your
> thumb in the index maybe.

You do have six "thumbs" in Papyrus - Alt+Shift+1 - 6 for setting,
Alt+1-6 for using (you have to load the file directly to set them).

Literally flicking through the pages to see
> if there's a chapter title that catches your eye.

You can do this as well on the screen. It's more a matter of
emotional preference than of logical sense, I guess.

> implications for the software producer. I'm just stating my view!

Yep, don't have problems with that - we WANT to know all your opinions
:-)

You could also run a program that is for a 1 meg machine:)

If you have the GOOD Fastcopy 3, disk copier, this will give you an idea on what memory you have, although it won't say 1 meg, 2 meg... but you can work out if you've got more than 1 meg etc.

A 1 meg machine can copy a STANDARD (9 sector x 80 track) in one go, without disk swapping on a single disk system.

Some art programs allow more than ONE screen in memory at a time with more than 512k, I think one is Degas Elite but I think Neochrome in it's reincarnations added screens!

Also, I think, some program language (editors) like Devpac will give you an idea of what memory is left; and the same can be said of some word processors!!

Thanks, thats cleared things up :-)

Magic improves quite a lot of things by the look of it.

Hi Steve,
I won't believe you until you back up your answer!

I've owned 3 different models of SC1224's and they all had speakers.
So which monitors don't? Mono?

Andy

>disable the ST's 512K RAM.
>
>I'm hazy on the exact details, but this should be enough to give you the idea.

From the manual:
Using small snippers or scissors cut the end nearest to the MMU chip of
the following resistors for the bank(s) you wish to turn off:

Bank 1 Bank 2
STFM Type I R61 and R60 R71 and R72
STFM Type II R90 R91 R93 R94
STFM Type III R61 R60 R71 R72
Mega 1 ST R68 R70 R148 R149

Bend up the cut end of each cut resistor and attach a wire that goes to
the +ve end of the nearby large capacitor.

Regards, /Peter/

Just curious how easy it is to set all this up? The one big
problem with MiNTNet is the installation. With IFusion what
is the benifit to running the MiNTNet version of Amail and
Aftp? I though the Atack guys made an IConnect OVL??
That comment I don't get. There is not that many GEM only
MiNTNet apps, so what you have is alot of work that went
into something that will allow magic users access to
all the boring text based unix apps. Cool! :-)))

The very stuff most wish to avoid from what I gather.

I would bet a few might find this useful, but from what I've
seen in the past here not that many. If someone needs some
serious networking and wants to stay with magic, then
I guess they can try this package. Hope it works as advertised.

Exactly, he is making a very easy installation programs etc. I only received this info last night, and asked for more information, he was very vague.. But he did mention MagiC Users not wanting to type in ifconfig sl0 addr xxx.xxx.xxx.xxx dstaddr xxx.xxx.xxx.xxx mtu 150 link04 etc etc to configure a serial port :-)

> is the benifit to running the MiNTNet version of Amail and

The whole package will be freeware, so I think it's great. I think it will be important for:
MagiC preinstalled in new milans
new milans now have ethernet cards
drivers available for mintnet...

7339. Falcon Keyboard is fixed!

Newsgroup: comp.sys.atari.st
Date: 2000-06-21 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8irfrj115vr@enews1.newsguy.com>
Source record: 60557

Well, I just finished going through the long and tedious process of repairing the flaky keys on my Falcon's keyboard.

As I mentioned a while back, some of the keys only seemed to work about 60% of the time - and as a side note, I did install the "TT-Touch" key contacts in it back in like 1995 or so.

Anyway, several of the key contacts were indeed worn out (some were even cracked and or split open slightly). So I checked them all, tossing out the bad ones. And fortunately I had kept my old original "mushy" contacts, and had a few spare "TT Touch" contacts as well. I cleaned the circuit board contact points with contact cleaner, and [after only 2 attempts!], managed to get all the keys working well again - with the "mushy" contacts being used for SHIFT, CONTROL, ALTERNATE, and the function keys.

Probably more information than you needed to know, but I wanted to do a little "practice typing" on the keybaod to test it out.
;^)

I should probably still invest in Mario Becroft's QWERTYX adaptor though...

>with the data rate?

Well, I have noticed that some MP3 files either play incorrectly or don't play at all on my Falcon with Aniplayer or Falcamp - often I receive an error message that the file "isn't an MPEG file" (or words to that effect) .

I'm not sure if it's due to the data encoding rate used, or the type of file (joint stereo for example), but just that apparently some MP3 files cause trouble with the current Falcon players.

The one's I've made were originally recorded on my Falcon digitally as stereo AIF files using Cubase Audio (with my DAT master tapes being the source). I then converted them to WAV files using a small conversion utility from Roger Burrows of Anodyne Software fame, then the WAVs were copied to SyQuest carts, and transfered to my PC to encode the MP3 files using Audio Catalyst. They were encoded at a constant bitrate of 128 kbit/second, using MPEG layer 1 in joint stereo.

I then tested all the newly created MP3s on my Falcon, and they played back perfectly. Hence my calling them "Atari friendly" (that and the fact that as I mentioned the songs were originally recorded / sequenced on my Falcon). ;^)

I wonder if those are MP3s with variable bit rates. Do you know if
those two programs support MP3s with VBR? Those can cause problems in
some PC programs, too.

In Papyrus I just highlight the grublin and then click on the
"ebosination" menu. Merkinols are added according to the
context, so I don't need to browse deep into the manual... ;o)

Daniel.

> ???

Hi,
You're right.
The SCSI bus can't be accellerated reliably because of the hardware used. When the bus speed is accellerated to 40MHz instead of the original 32MHz, the SCSI-bus can't be used at all on many machines (if the accelleration doesn't give a separate clock to the most sensitive circuitry).
IDE gets much more accelleration when using various accelleration cards, since it's more dependent on the CPU or bus speed.

OK so far.

>The task bar gets to the end of the sequnce and the program then freezes.

Make sure that the running order of your HSModem components is correct.
Sockets.prg should run immediately afterwards.

>The following messages are displayed
> Status Get IP addresses
> Command Service-Eintrage (there's an umlaut over the last a)
>

Service Entry.

I don't know what entries you have in IConnect, but ISPs that I've set it up for
recently have needed very little work.

In the Modem page set your port and modem init (atz here)
Account - your login, password, ISP tel number and 0.0.0.0 as IP address
Login - just a "Done" with the PPP box ticked
DNS IP address - again 0.0.0.0 (the ISP should pass this detail)

Fill out the other boxes to suit Demon's details.

This should do it.

I think you should better not use 4x anyway since I quite some times
heard of troubles at reading 4x burned CDs on other drives
(independent of computer and recording software !) but I never
heard of troubles with 2x burned CDs. Even shop-assistants trying
to sell their newest fastest hardware admitted that one should
use 2x speed for reliability. And with 2x speed I never had any
troubles neither on my falcon nor later on my audio CD player.

One, two or a few of these hacks are also supported by Audio Sculpture
.... I think we even supported 16 bit Stereo on STEs, but I can't
remember what hardware was used.

7356. MagiCNet

Newsgroup: comp.sys.atari.st
Date: 2000-06-21 00:00:00 UTC
From: Bengy <bengy@home.com>
Message-ID: <B5760BA6.32B0%bengy@home.com>
Source record: 60633

MagiCNet (June 21)

One of the largest and perhaps most interesting rumor that has been floating around is the upcoming network support in MagiC. Lately, we learned of the possibility of the so called "MagiCNet" being MiNTNet compatible, thus opening up a world of new internet software for MagiC users. Now we have confirmed it with inside information. Here are some of the juicy details:

MagiCNet (Or MagiXNet, as it is written to the screen upon bootup) is almost complete!

The package includes Device drivers, tools, test programs, and serial and midi drivers, ethernet and the programmers socket library. The mentioned 'ethernet' is the authors Pocket adapter project for which he's ported the software driver to both MiNTNET and MagiCNET. For you techies out there, they are source compatible with only a few #ifdef MINTNET in the sources because MagiC and MiNT kernels are completely different. LANCE, RIELB, DE600 and other drivers can be compiled fine, but have yet to be tested.

Already, MiNTNet versions of aMail and aFTP work great under the MiNTNet overlay. (Tests were done by using a 'fake' MiNT cookie under MagiC)

Now that compatibility with MiNTNet is at a high enough level, work is underway on a Dialer. The dialer will probably be pppd but with a modern GEM interface. A GEM port configuration utility is also planned.

One last point worth mentioning: Although more tests need to be carried out before this can be officially confirmed, early tests suggest that MagiCNet actually runs faster then the 'real' MiNTNet!..

As more information is compiled it will be added to the MagiCNet page of MagiC Online. (Not yet online)

Yours, with sympathy and all blessings,
Bengy

I'm sure iCab is fine but I thought of DHTML support which the Basilisk
compatible Netscape/MSIE versions are capable of.

Personally, I'd like to see other emulators (M.E.S.S./M.A.M.E.!).

Ahhh I know exactly what you mean! I have mine rigged through an old
Technics Hifi amp through my home made sub. One accidental press of
the keyboard with and it absolutly kills the sub. The coil former pops
out of the magnet and makes a loud cracking noise.

Thats why I use a CPX to turn it off! Why Atari put in that annoying
sound everytime you press the keys is beyond me.

Hehe .. the company who sold it for us went broke straight away .. :)
But Sync (Synchron Assembly) still hangs together, though no one is
doing anything on the Atari these days. I've tried to get a newer
version of AS (the one that was sold is nowhere _near_ as good as the
one we had in-house*) out but the members who did the program are too
lazy to look through their old disks ...

> lund1@earthlink.net

I would not say "bummer" as now anyone can use it to good advantage.
It was an expensive package for it's time. However in order to use
it's SMPTE capabilities you STILL need the hardware Box! The 7.1B
version is the UPdate for SMPTE Track (available on my site...see sig)

Just thought I would throw that in. Hope you get a response for your
box...or KEEP IT and produce some good music. You can also use the
UpDate as it has a few new features such as Chord generation, ect.

Some butt-holes think that quoting a few paragraphs in every message they reply to is
'OK' coz it doesnt cost them anything. IMO it just shows their ignorance. If a few
more people quoted a bit more considerately then some peop's would be able to poll
for mail twice per week!.

You may think its a joke Lonny, but frankly your one of the worst offenders, you always quote an entire post in your replies, this is plain inconsiderate. There are some people over here who can only afford to connect for mail twice a week. There are only a handfull of people who dont think before they reply and it does do serious harm to some people hobby. Would it really hurt you to think of others for a change, and before you type it, a killfile is not the answer.

>that was salvaged out of a dead Commodore 64. Works fine except you
>need a switch to switch back to 19.2k speeds or lower.

Similar to my mod. Except I used 2 74LS74s and a couple of TTL
oscillators to give me 57600, 38400 and the normal speeds.

>In the System Solutions catalogue (spring 1994) it clearly says "RSVE
>is a small hardware add-on to enhance the STs serial-port to 38400 and
>57600Bd with HSMODEM patch" whereas the documentation of the RSVE
>says it's not possible to get 56k unless the CPU is running at 16mhz
>or more.
>
>So who's right?

Both are. Here's what I experienced using my unaccelerated STE using TOS
1.62, or Magic 5.11, with HSModem 0.7 and a 33k6 modem.

Under TOS, the serial port handles 19200 with no problems although
moving the mouse causes a few dropped characters at 38400 and 57600 is
unusable. Using STing, this means the highest reliable speed is 19200,
although using Connect, or GSZRZ, 38400 works for BBSs or null modem
transfers as long as the mouse interrupts are turned off.

Using Magic, the serial port handles 38400 with no problems although at
57600 there are sometimes a few dropped characters. Using STing, this
means the highest reliable speed is 38400, although using Connect, or
GSZRZ, 57600 works for BBSs or null modem transfers as long as the mouse
interrupts are turned off.

I have used STing and Magic with the port set to 57600 and the transfer
rates were slower than at 38400, probably due to the dropped characters
and resent packets.

Since it seems to me that the main problem with a faster serial port are
the caused by slow interrupt processing, probably the keyboard/mouse
more than any others, accelerating the ST will speed them up and reduce,
or completely remove, the dropped characters.

Thanks Tim for the reply. And BTW, you have a GREAT site! Had fun
checking it out.
Well, I've kind of moved on to a different platform so I don't need the
Atari stuff anymore....makes me feel like a bit like a bastard ;(But it
served me sooo well for soooo long that I hung on to it for a few years.
But now it's time to part. I'm just surpised to see this equipment going
for next to nothing(literally!). For running just midi, or even syncing
a an Atari to run midi to a DAW would work wonderfully.

Well, I'll make another post later. Have some stuff some folks might be
interested in.....

Thanks again, and I'll check out the update.

Hi,
I think this is mostly a myth. A couple of years ago it ws true - but I've burned both audio and data CD's at 8X with my Yamaha SCSI-burner without any problems on my PC. I haven't received my update of CDRecorder (my current version doesn't support my new burner), so I haven't been able to make a similar test on my Falcon yet.
I believe it depends heavily on the stability of the burner and the CDR's. There are still CDR's around, which are only guaranteed up to 4X burning, so I guess it'll take some time before everything's running perfectly smoothly...

Best regards,

Hello all,

I would like to find out where I can buy a reasonably priced Mega STe.
I used to own one a long time ago and would like to get one back and do
some stuff with it.

If you have one for sale or know where I can buy one for a reasonable
price, I would appreciate it.

Thanks

-Marlin

Well, it had to come to an end someday... I have to sell my old Atari stuff
to make room for other stuff.. :(Fortunately, my Atari will still live on
through emulation on my iMac, but emulation ain't perfect.

Anyway, below is a list of what I'm selling. Right now I am asking
$250+shipping for all of it. I will consider breaking it up if I can't find
a buyer for the entire package. I want to sell to someone who will take care
of this stuff and appreciate it the way I did. Reply to this in email if
you're interested!

Original Software:
Phasar 3.0 - original box/manuals
Timeworks WordWriter 2.0 - original box/manuals
PC-DItto 3.0
GFA Basic
1st-Word
DB Master One/Megaroids
Space Harrier
Metro Cross
Epyx World Games
Epyx Battleship
Top Gun
Harrier Combat Simulator
12 Computer/Atari ST User/STart! disks

Books:
GFA BASIC
GFA BASIC Training Reboot Camp
Atari ST Internals
1001 Things To Do With Your Atari ST

Hardware:
1 1040STe - 2 megs, TOS 1.4 or 1.6
1 520ST - Half-meg, TOS 1.0 or 1.2
2 SF314 Double-sided double-density drives
1 SC1224 Color monitor
1 Beetle Mouse - may not work
1 Atari standard mouse
(the CPUs, disk drive, and Beetle mouse all come in their original boxes and
have the original documentation, as well)

Magazines:
3 Issues of Current Notes (Apr, Oct, Nov 93)
1 AtariUser (Apr 92)
2 Atari Advantage (May, Oct 92)

1 Atari ST Informer (Dec 92)
1 Atari Interface Magazine (May, Fall 92)

PD/Shareware Library:
168 PD/Shareware disks
All programs are archived
Each disk is categorized (Productivity, Communications, Games, etc)
15 Magazine cover disks
The library includes one set of master disks, and then anywhere from 1-3
copies of each disk
The library also includes two bound catalogs
One lists all files in alphabetical order with the disk number they
appear on
One lists all the files by disk number order

>was not good, local problem, private "joke"). Problem is not that
>ST-Guide is no longer supported (for the moment) but that it's difficult
>to print a whole HYP file.

Not really - as long as you don't need the cross-references. All you have to do is to run HCP with the command line -v -oOUTFILE INFILE.HYP and you will get a full ASCII version without any of the @ commands or node titles etc. Or use -r instead of -v and then load the STG file into Look'n See, which will strip the commands and convert it to plain text complete with the heading text for each node. 'Print' this to a file and you can then clean it up in a text editor very easily.

It is also possible to extract any images and print them with Imagecopy or similar programs - I have used TW3 for both text and images.

The main advantage of STG is that it is very fast as it uses the system font with no reformatting.

>Another way would be html but the problem is the same for printing than
>with ST-Guide.

And it is much slower - even on an accelerated Falcon.

The one very unsure thing with printing manuals is: how many?

Nowadays there are internet printshops that keep only the digitalised
version of the manual and print on special laserprinters etc. the
book when someone asks for it.

Met vriendelijke groet,
Ronald van der Kamp

>For falcon mkx 14mg ram, what size and make will work in this machine? I

I've got a Fujitsu 2Gig MAT series 2.5 inch notebook drive in here, but I'd
recommend at least double that size if you want to stash audio files on it.

You can also fit the physically larger drives that are fitted in PCs if you get
an adaptor. Abingdon Synthesis Projects do these, hopefully Chris will pop up
with his contact details. Those drives will still fit inside the Falcon's case.

A very long shot - the answer's no.

The only paper-based magazine that I know of is the relaunched/retitled Atari
Applications (formerly STApplications) from the FaST Club. Contact Paul Glover
at stclub@cix.co.uk

Emulators aren't such a big program, as the majourity have released the source code. There are many 68k versions of emulators (ie vMac, MAME) that have been ported to run on the Amiga and 68k Mac's. It just takes someone to sit down and compile to code to run on Atari.

I'm looking forward to the Milan 2, and I really want to buy one. I just wish someone would port/code a working ZX Spectrum emulator :)

7401. Wanted: Atari Mega 4 ST Computer! Buy or Trade!

Newsgroup: comp.sys.atari.st
Date: 2000-06-23 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <8ivbt5$lb6$1@user2.teleport.com>
Source record: 60498

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Not that easy if you don't know what you are looking at:)

If all 4 simm slots of an STe are filled, it could be either 1, 2.5 or 4
meg!!!!

If it's an STFM, it could be either 1, 2, 2.5 or 4 meg.... as some
memory upgrades don't tell you on them what they are!

7404. Atari compatible Laser Printers

Newsgroup: comp.sys.atari.st
Date: 2000-06-23 00:00:00 UTC
From: bindon@madasafish.com
Message-ID: <sl6m0th0e7f16@corp.supernews.com>
Source record: 60501

Hi!

I would like to get a Laser printer for my ST. The 3 packages I use
the most are Papyrus v4, Imagecopy v4 and Scooter. All three have
drivers for HP Laserjets. Papyrus and Scooter have drivers for the Atari
SLM. Getting hold of an Atari SLM would be difficult and I don't
think it would work on a Milan II because it needs the DMA port.

I have been looking at some PC mags and have seen a HP Laserjet 1100/A
for 232 GBP. There is also the Epson EPL-5800 which is extremly good
value for money at 236 GBP (more memory than the HP etc)

There is also a Brother HL-1030 which is cheap at 186 GBP. It does
clearly say that it is a "Windows dedicated printer"

Will the HP drivers work for the Brother and Epson? Has any one had an
experiences with these lasers or any others?

Thanks in advance.

```

> There is also a Brother HL-1030 which is cheap at 186 GBP. It does
> clearly say that it is a "Windows dedicated printer"

Cheap laser printers are usually GDI printers. They follow a similar concept as the SLM 804. They are stupid printers and the work (setting up the laser bitmap) is done by the processors. So they are as well similar to the SLM 804 in compatibility: The SLM works only hooked up to Ataris, GDI printers work only with Windows 9x. They doni¿½t work with MacOS, Linux, TOS or anything else.

> Will the HP drivers work for the Brother and Epson?

Have a look at the bigger siblings of the cheapest (= GDI) printers and have a look at the manufacturerï¿½s websites. We have a Brother HL-1240 laser printer at the institute. The webpages of Brother say, that it can be run with a HP Laserjet II driver on the parallel port. So I think, this one might do with Atari as well. (I didnï¿½t try!)

Regards,

Kerstin

And it works on ALL Ataris;-). There are a number of games that use
midi for sound or as a link to play between computers. Don't forget
Space Quest which has amazing sound via midi.

There is quite a few Public domain games that use Midi links and can
be found on the Umich archives.

Later Brian.

The aixiTT card is not inherently stable and requires a modification.
Contact the manufacturer for details.

2.5" not recommended for audio. Before CENTurbo II, my 1.2GB 2.5"
Hitachi was OK with 2-track stereo but only with a cooling fan
blowing over it. I had to add a 3.5" (IBM Deskstar, as IDE slave)
for reliable multi-track.

>You can also fit the physically larger drives that are fitted in PCs if you get
>an adaptor. Abingdon Synthesis Projects do these, hopefully Chris will pop up
>with his contact details. Those drives will still fit inside the Falcon's case.

It's a bit of a hack, and squeezes between PSU (with the ribbon
cable exposed to the high noise area! Don't do this if you value
data integrity) and FDD. Best to re-case the Falcon and mount the
drive properly and securely.

Source record: 60516

Hi,

Anyone out there using STing with a PSINet service provider?

As of a couple of days ago PSINet/Interlog can only be accessed with PPP.
Even with the help of a few people here, I have never been able to
establish a PPP connection. Now I have no choice but to get it to work,
buy a new computer or change providers.

I get as far as getting the dynamic IP from PSINet and then all I see is
"Initializing Link" and it eventually timeouts out.

Is there any very important settings in the configuration files that must
be set using info from the ISP?

Thanks

Ken

It certainly does get through the crossover on to the LF side. It is
rather lethal if turned up loud. I've just checked the output from
my ST with a scope and it clearly reads somewhere around 4.16Khz.

You're probably thinking that this is HF, yes to some extent, BUT it
is square wave. Square waveform is rich in harmonics and will contain
low frequency and mid frequency hidden in it. Thats why it's thumping
our speakers out even though it sounds quite high pitched.

<<not really related>>
One thing to play about with is if you have a Yamaha GM keyboard or
whatever put it on sound 80 (Ocarina). Rig it through a sub up loud
and hear the sweet sounds on the low octaves. Whatch the cones fly as
well!

Because I'm playing the notes so low down I can't really hear
much but it can show your sub off well. Even more fun is pressing two
notes together, one note above the other. You get this nice
pulsating noise!

Well, got my copy of papyrus 8 last night and it seems to be excellent. I always prefer reading a book to a screen and printed out the manual.

One excellent innovation is the Always Replace This Font option when opening a file. I recently changed from Baskerville to Goudy Old Style and no longer have to chose the font to replace.

: Using faclon mkX and hddriver 14m ram, yamaha 4416sx burner, cdrecorder, can
: only get it to burn at 2x, when I try in4x, I keep geet scsi error,
: re4corder not ready. Is there a way to improve this situation?

I have read the other posts, but am not understanding something, despite what else is said:

The other posts are (?) presuming you are reading from another CD-ROM drive and writing using
your Yamaha 4416sx in one operation?? If so this is not stated in this original post. In fact
your post does not mention the source that I can see.

The most common situation is where Falcon owners have the audio files on their hard drive and
are then writing these audio or data files to the CDR.

There really should not be any problem whatsoever given this type of situation. I have a C-LAB Falcon and I know two other C-LAB Falcon owners and we all own Yamaha CD writers, not all the same models - all different in fact, and I am 100% certain that we all write many CDs, Data and Audio at 4x speed without any problems, none at all!

So I would say that a clearer explanation of your situation would be in order, your system and how you are doing it and so on.

On a different note, but possibly related, one of these C-LAB owners I refer to above was trying out Aniplayer and wondered why it would only play AVR files for 30 seconds or so and then freeze the computer - well the simpler answer was that he had the graphics mode set to 256 colors - and this ties up the falcon a great deal.

When he set the Falon graphics to 2-color mode then there was no problem whatever.

Maybe this is worth trying in your circumstance.

Either way - if you are writing a CD from files off the hard drive then 4x writing is easily
possible, but reading off a CD-ROM and then writing in one operation, well I am not sure if this would work at 4x writing, but then in most cases this way of writing is not necessary at
all.

Please post us with more details or criticism of my story, I would be interested to know the
real answer to your problem.

7436. Re: V90 Modem Driver?

Newsgroup: comp.sys.atari.st
Date: 2000-06-23 00:00:00 UTC
From: Peter_Schneider@su2.maus.de
Message-ID: <200006231735.a56203@su2.maus.de>
Source record: 60533

Hi Steve,

SS>If you look in the small print, they usually say *not on a standard
SS>ST!!!!
but there is no objection to run a 56k modem with a 'normal' 8MHz ST.
Of course, that ST will never profit from the modem's speed.

But you can do so!

A friend of mine who owns a Mega ST4 asked me what modem to buy, and I suggested to him to buy an Elsa Microlink pro, for (maybe) one day he will switch over to a 'standard' PC. So he did, and he's glad although his (only) modem port can't exceed 19k2, but we are going to insert an USART chip (CD 4040, 2 US-$ about) that will speed up that port to 38k4, which is more than nothing.

Message-ID: <EWy45.296$LG1.2147@newsfeed.slurp.net>
Source record: 60595

Hi there,

Anyone using MyMail version 1.00?? I just d/l it las night and set it up. It seems to be acting funny. When I type a response the cursor does not stay with the words I am typing. It moves faster to the right. In orderwords, let's I type Atari. The cursor should be to the right of the i in Atari, but with version 1 of MyMail, it is 2-3 spaces more to the right. Also, the email addresses in emails, are un-readable but function like they are suppose to. Anyone else experiencing this?

Speccy v2.07 should be updated to add 128k support and AY soundchip
emulation. There are lots of spectrum emulators with source code out there.

Well, you're certainly more ambitious than I since you bothered to read
enough of that to make your clips and comments. I only skimmed it and
decided it was easier to tack onto the response. Obviously the market
for Atari that he imagines is not there, otherwise Milan would be
selling like hotcakes.

Hi Lyndon,

LA>Will the HP drivers work for the Brother and Epson? Has any one had
LA>an experiences with these lasers or any others?
I've been printing with a HP Laserjet 5 L since February '95. As I had to replace the toner cartridge a couple of weeks ago, I knew that the HP 1100 used the same cartridge, a fact that makes it more probable to get that stuff for reasonable prices.

So I'm happy with that printer. All my soft comes along with a suitable driver, e.g. most _deskjet_ drivers do as well.

Keep away from GDI printers because they are 'Windows only'! If the paper is being vertically hold, be sure to cover the printer whenever it's not used!

The card takes 5V, FPM or EDO, PS/2-style SIMMs. You can use any SIMM betwen
4MB and 32MB, as long as the RAMs used have a symmetrical RAS/CAS mapping.

There are a lot of bad SIMMs around - keep away from SIMMs with 3.3V RAMs
(often with a "V" in the middle of the number) which have extra diodes on
the SIMM, and from SIMMs with a suspicious number of solder jumpers - these
often indicate bad DRAM chips.

7448. Installing OverScan

Newsgroup: comp.sys.atari.st
Date: 2000-06-24 00:00:00 UTC
From: george@moulder77.freeserve.co.uk
Message-ID: <8j0v90$nr4$1@news6.svr.pol.co.uk>
Source record: 60535

I have been trying to instal OverScan to a STFM with TOS 1.4.

Strangely enough sorting out which track of the PCB to cut to isolate the MMU and Video-Shifter proved to be easy, but I am having difficulty in picking up the new Display-Enable signal from the location the document instructs me to, and I quote:-

"Make sure to use the Composite Sync Signal directly from the Emitter of the driver (buffer) transistor. (Take a look at the circuit diagram of your ST!)"

Well of course I haven't a circuit diagram, but I hope somebody reading this will have. I've tried to trace where it should be connected, but the PCB at this point is very congested and I can't even decide which transistor is the one referred to.

I have tried using the Composite-Video output, pin 2, of the monitor socket unsuccessfully, but this failure is implied in the instruction.

The motherboard is marked C070789-001 REV.F2 and GX-211 VO 3890

Would anyone have a circuit diagram from which they can tell me in detailed layman's terms the right transistor to which to make this connection?

Thanks in advance for any work this causes you!

George Moulder

if you do decide to change providers, I'd suggest going to LOOK
(formerly Internet Direct). Both Ken Macdonald and I have used Falcons
with STing with no problems hooking up via PPP, and we could probably
get you a working script to get up and started. BTW, LOOK I believe
still supports SLIP.

I've had nothing but trouble in the one month I was with Interlog:
apart from one tech who was genuinely concerned why I couldn't log into
it via SLIP, I had nothing but cluelessness from the rest of the techs.
Our Phoenix editor has recently dropped his PSInet account due to
concerns he had.

Hi all!

Can anyone recommend a better Telnet client for STiK/STinG than the usual Telnet/TelVT101/TelVT201/Telstar that have been around for ages? And no I'm not going to change to Iconnect so that I can use Fiffi (I think)!

It needs to be fully VT100 compatible, unlike the others as above.

The reason I want to get a better one, is that I'm into playing the original MUD (multi user dungeon, written originally in 1978!) to be found at:

telnet://british-legends.com:27750/

Cheers!

James

7457. bring back atari

Newsgroup: comp.sys.atari.st
Date: 2000-06-24 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <8j3bluelp1@nnrp1.deja.com>
Source record: 60544

As far as i understand it Atari had already declared bankruptsy before JTS sold Atari for 5 million USD, so essentially JTS couldn't give a sh*te how much they got for Atari, i guess their philosophy was better get something now for Atari, then nothing for it later on
According to a @friend@ of mine JTS only sold Hasbro the IPR's (intellectual Property rights) to Atari's software archives, namely pacman, digdug, star raiders etc...This has nothing to do with the Atari brandname and logo, and from what I understand it didn't include the hardware (vcs/lynx/st/e/falcon/8bit etc), I know this as my "friend" obtained the remnents of Atari's rights to pacman (for the home)

My idea is for someone to 'obtain' the rights to Atari's h/w patents, and do some deal with wms (who own the remnents of what was Atari's coin up division, the original part of Atari) i say this because, i guess everyone and his wife knows that hasbro have no intention of extending their atari divisions interest in the videogames/ computing ind. outside of software, obviously those socalled experts/pro's at hasbro don't know of Atari's past as a software house, because if they did, hasbro wouldn't have bothered buying Atari's s/w archives... Anyway back to my idea... Do some sort of deal with wms, which essentially gets the atari h/w back into mass production and mass distribution... And essentially do the same thing that IBM did with the PC... namely allow other companies to manufacture Atari (3rd pty) compatables (you can forget, ppc/k7's and p11/111 sh*te) only anything compatable with 65*** or 68*** will do, obviously update the h/w to reflect current tech. standards. i.e removable hard drives/ mass storage dev/ built in cdroms/r-writables, dvd roms etc... and a better version of sio/usb etc (which is one of the same thing anyway) and sell it at the £250/350 barrier... At that price it would be a good seller, forget microsoft (ms) supplying the o/s or dos (we don't want their sh*te in our system) we should go along the lines of what linux is succeeding in acheiving, but without having to adopt linux, allow people to obtain h/w and systems s/w upgates very inexpensively using a similar system to pd/sharewhere, whereas once the user has registered the purchased product (this would be done while he is purchasing his new atari system) all he has to do is send off either the h/w or systems s/w to the manufacturer and for little more then the price of the upgrade/& postage the user will have an up to date system, rather then having to by new s/w or h/w which is unnessesary, this will mean that compaNIES LIKE M/S OR INTEL wont be able to dominate the market like they have, as 3rd party atari s/w and h/w manufacturers, whilst they won't be rolling in it so to speak, they won't have the same problems regarding compatability, bug's etc... after all let's not forget the liitle problem that AMD processors have with windows 95 and 98, now if my idea

was successfull, this wouldn't happen because anyone making s/w or h/w for atari or 3rd pty compat's would have to make sure that his/her product was compatable with all h/w and s/w on atari systems, what would eventually happen is that because Atari the computer firm, has nothing to do with the Atari division owned by hasbro, because Atari systems would becomme popular again, people will want to see Atari's software archive played on Atari's h/w, which means that hasbro would have to seek permission from Atari (comp) to write s/w for Atari and Atari compatable systems, Atari (comp) on the other hand would want an assurance that any thing that hasbro releases on the Atari, isn't then marketed on other competing systems, also that any software rights that was previously owned by the old Atari, would not be allowed to be marketed or sold on other competing systems, and that the name ATARI was not in any way shape or form associated with products marketed for competing systems... essentially keeping the ATARI name unique and not only that but it means that if you buy a product with the name Atari on it, you are assured that the product will only play on Atari systems, and not for m/s sega/sony/nintendo etc...Now before y'all accuse me of being ant m/s or japanese etc... look at it the other way, Say since 1990 when was the last time sega sony/ nintendo or m/s(intel) done anything for Atari.. I cant remember the aforementioned producing anything for atari (h/w or s/w), If they did I must be living on another planet, so in practice, why should Atari produce software or products for competing systems

And with regards to the IPR's that Atari have (the old atari that is), and since according to various commentators in the videogames/computer ind. account's for about 90%plus of everything that has being produced since Atari's inception both h/w and s/w relevant to computer or videogame or interactive entertainment, basically mean that any 'technological developments' that have being instigated for use in h/w and s/w for computer, videogames and interactive entertainment in the last 25-30 years can be traced back to something that Atari themselves, invented, pioneered or created, after all if ampex can still obtain royalites from video tapes (30 years after the things were invente), why didn't Atari start hammering s/w and h/w manufacturers now for those royalties..., because looking at it logically sega, sony, m/s nintendo, activision, eidos, even hasbro, are basic using ATARI Technology or inventions and putting them or marketing them on someone elses system ... Now if you call yourselves Atari users, and that is Atari users in the true sence i.e That you still own the h/w and s/w and are still actively using the system daily... And not one of those sad sod's who use 'emulators', I don't count that as being an Atari user, in the true sence... still getting back to my point... As Atari users(in the trueist sence) would you rather have atari technology (h/w & s/w) used in Atari systems, or would you rather see Atari technology seen in someone elses electronic box

And with regards to customers or market share, the fact is there allready a ready made market for new Atari systems (provided that they instigate backup, support, cohesive/consistant sales and marketing

programmes etc) after all you have those that now have pc's, mac's amiga's etc, and given that if the new Atari's were getting the same support that these 'other' systems enjoy s/w wise with heavyweight programmes and entertainment s/w to compete with msword, lotus note, borland c, tomb raider etc... After all they used to be Atari users, so what's stopping them now...
Then ofcourse you have those that own the "jap crap" i.e sega, sony & nintendo, of to put it another way Atari technology reverse engineereed by the jap's (atari technology in someone elses electronic box), those who as we all know also used to own Atari (though they'd hate to admit it)
Then you have the rest of us (consumers that is) who are wanting to get ahead in videogames or interactive entertainment, who are wanting to buy a quality up to date system, with quality backup, service, support and software, from a supplier that beleives in advancing the technology it was founded on, and supplier that has shown that it can be inovative and not someone selling Atari technology in someone elses box, and not some pale immitation like sega, sony or nintendo... I guess it's about time that users of these competing systems wake up and smell the coffee, and understand that what your buying is atari technology with someone elses name on it, stop being such sad sod's and why not buy atari technology with ATARI's name on it.... That's if you call yourselves Atari users (in the trueist sence)
P S when someone mentioned msdos, why was it that disinfectant or detergents came to mind... no joking ofcourse

If anything, ATARI used a lot of other companies' technology.
All of its monitors, for example, were other companies'
technology in a box with the Atari name on it (anything from
Philips, JVC, Samsung, Goldstar to Moniterm), Portfolio
(DIP Systems organiser), ATW800 (originally developed by
Pherilion Research in Cambridge, England, and used a Mega ST
as the I/O processor), Lynx hand-held games console (originally
developed by the two principal AMIGA designers, Dave Needle and
RJ Mical, then literally had an Atari logo slapped on it),
Jaguar games console (originally developed by Flare, in the UK).

> all.

Hi,
I've had the following explanation from SoundPool:
SCSI is too slow to handle 4X burning, so if 4X is to be used, only an IDE-disk is recommended.

I did also come to this conclution myself when I helped a friend after he had just bought a 4X burner and experienced exactly this situation that SoundPool told me when I asked about why it wouldn't work... After a few audio tracks, the burning just stopped (buffer underrun) - but when we copied the files to the IDE-disk instead, it worked perfectly at 4X. I tried this both on my own, somewhat accellerated, 16MB Falcon - and on my friends' Falcon, which was in it's original appearance with only 4MB. Both were, of course, CPU clock patched and perfectly functional with CAF and always running with 2 colors to keep the speed up...

Hi,
You should be able to use any laser printer which is HP laserjet compatible - but don't even look at the cheap "Windows only" printers - they won't work at all. HP laserjet (which almost all laser printers are compatible with) works with already existing drivers in just about any program.

AFAIR, the Atari board requred nibble-mode DRAM. The AixTT works with normal
FPM or EDO, as long as they use a symmetrical RAS/CAS mapping. I am not sure
if nibble-mode DRAMs from an Atari board would work.

I don&#65533;t think I am the only one that thinks this is crap! Often it is more irritating with people that quotes nothing, so you have to go back and read though a couple of old postings to get the picture. I have a high phone bill as well (paying by the minute) but thinks it is _very_ ok to quote important parts of the previous message. Why download every post instead of just browse through the headers? This has nothing whatsoever to do with ignorance, I suspect you could solve this by using another newsreader, allowing you to scan the headers before you download the whole thing.

```
> >this ain't costing me nothing...
>
> But it is costing me.
```

Its costing me too, but I don&#65533;t blame others for that. It happens I leave quotes from previous messages just to avoid confusion, has nothing to do with ignorance at all. Just choose what to download and all is well.

You can essentially do this in the Windows version, by creating your standard letters, storing them as templates, and then open a template. I assume the TOS version is similar.

And just now I thought of a minor improvement to the Windows version, when you minimize the main Papyrus document window, also hide all associated windows. For instance, if I minimize all of my document or database windows, close or minimize all other Pap windows such as search and replace. I can't think of any reason I need a Pap S&R function if there are no windows to search on. <G>

They probably don't know how to deal with ASCII any more. <G>

More likely, it means less work for them. Suppose you got 100 ASCII emails, and had to separate out just the rï¿½sumï¿½ portion of the body text and save them. That could represent a lot of time.

Now, you could send an ASCII file attachment, but then it wouldn't be pretty to look at. And they are now teaching that how your rï¿½sumï¿½ looks is as important as what it contains.

I wonder what happens if the sender of the rï¿½sumï¿½ uses a font(s) the receiver doesn't have? <VBG> What happens to the appearance then, if the sender has failed to embed the fonts in the Word doc?

7469. TT Question: Floppy Disk Drive

Newsgroup: comp.sys.atari.st
Date: 2000-06-25 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-FCAA6F.14563125062000@bigmomma.idirect.com>
Source record: 60465

at the recent TAF flea market, I was able to get ahold of one of DMC/MGI's development TTs, and I want to set it up now as my main Atari machine.

However, two questions:

1) I've discovered that it will only read 720K disks. IIRC, there's a set of dip switches inside the hard drive bay, which, when turned on, will allow for 1.44 operation. Which switches are these?

Failing that, which brands of 1.44 drives will work with the TT? Preferably one that won't require me to hack up the front of the case to install (it's got the romboid-shaped button).

2) it also turns out that the TT has a German TOS in it! Is there NVRAM inside the TT which will allow me to go to English, or will I have to brush up on my Deutch? :)

Any help on this? I'm eager to get this thing up and running :)

I think this may be due to Harlekin's internal terminal program, which
is set to 19,200 by default, and this may interfere with other comms
programs. I have had similar problems with CixComm when Harlekin is
active. If you don't need Harly's terminal program for communication,
why not try disabling it? Perhaps by renaming the TERMINAL folder inside
MODULES\ to TERMINX or something like it.

..
>BC-FORTRAN77 VERS 1.3C
..
>And further: from the UK: PROSPERO FORTRAN77!!!!!!

I have tried both of these, and, in fact, used Prospero FORTRAN quite a lot.
It is almost a standard F77, no more, no less, but still with much more
features than BC. Several years ago I used to port F77 programs between my
Atari and a VAX without any particular dificulty. Even ported (and enhanced)
the then-standard Calcomp's "Plot" scientific-graphic library to Atari.

I think Prospero is more convenient to use than BC- has GEM interface
and libraries, standard GST format of object files, FPU support,
is compatible with Prospero Pascal and C, etc.

However, one should note that numerical accuracy of both these FORTRANs
seem to be quite poor! BC is practically unusable for any serious
computing, and even Prospero is not good enough. I found out that a
correct Prospero-compiled program transferred from VAX, performing
iterative loops with a lot of matrix inversions and trig functions (it was
some involved sort of least-squares-fitting) very soon accumulated errors
that led to almost unrecognizable results, while on a VAX, with Digital's
FORTRAN it worked perfectly.

I believe I heard when they first came out that the ZIP disk doesn't
provide the power required for the Link II. You can use it but it
takes some type of extra connector inplace to tape the power off one
of the other pins in the SCSI connection I believe.

Hello Joergen!

JN>Now there is a new version of MyMail out, 1.01, in which the problem
JN>with proportional fonts is fixed along with some other bugfixes.

The new version ist the first ever got to run on my monochrome PAKed Mega ST,
so I'm very glad about it.

But a few questions are left.

1. I' several mail accounts. Is it possible to define an InBox adnd
OutBox for each one?

2. Scrolling (mail overview, Aliases etc.) is a bit slow and funny,
because there are no real scroll bars (MagiC 5.13 monochrome). I think
the arrow keys (mail overview) scroll by page, the little empty
buttons more inside the dialog by line, right?

3. I can't delete messages. They get a diferrent Icon but don't vanish
form the list.

4. MyMail always gets *all* messages from the server. aMail, for example,
knows how to get only the new ones (since last login). This works only
with some servers, indeed.

5. Is there a german RSC out there? ;-)

bye,
=Gerhard=

Hi

I think comp.sys.atari.programmer may be a better newsgroup to ask a
question like that:)

Myself, I would either put the data on the stack just before I called
the asm routine and retrieve it from the stack (which is very simple) OR
stick it in a memory location. Obviously it all depends what and how you
are going to use the data etc.

|> another (e.g 'year_of_election' greater than 'year_of_graduation').
| . . .
|
|Hm - I didn't understand fully, I'm afraid (maybe a language prob,
|but I don't think so X-)).
|Do you want to check an entry wether it fits into your (database)
|needs or not?
|
|This can't be done in the same field, at the moment (but I guess
|it will in version 8.5, coming soon free of cost).
|
|You have to make another field like an alert field, where you check
|entries against a validation. But, as I said, v. 8.5 will have more
|functionality for that, it will come up with action triggers with
|related formulas.

I want to restrict the text in some entries to either 'yes' or'no'.
For example, one entry is called 'address_correct'. When I am
printing labels for posting, I do not want to send mail to those
whose address I know from previous experience is incorrect. I
therefore only use those labels where the text contained in
'address_correct' equals 'yes'. Now, if I did not have validation of
the entry, I might find that the person who entered the data had
typed 'Yes' or 'yes' or 'YES' or 'y' or 'Y' and so on and my filter
might not show all the proper addresses.

Atari as a hardware company again. What a thought!

My take on it to entertain this thought just for a few minutes.

First off, though what Atari did was cool, you have to admit, what has come
out since is quite awesome. I have fun tinkering with the Atari equipment and
using an Atari 800 for checking mail, but when you get a chance, look at the PC
version of Aliens vs. Predator and you'll what what I mean.

When it comes to Atari hardware of old, I was thinking it would be fun to
make electronic kits for radio shack to build 2600 and Atari8 computers. It
would be a fun introduction and much simplier to look at and understand than
today's multilayer boards. And once you are done, you can buy games from
various places and have fun with your home built machine.
Approach the older stuff from a hobbyist point of view.

Since any "Atari Corp" starting out wouldn't have much in the way for
funding research, the best way to start is to find someone with an "Atari-ish"
kind of product. Much like they did with the Portfolio or Lynx.

Or simply make a contract with Nuon to make an Atari labeled version. :)

The fact is, Atari was always one for displaying new technology and developments and then raking in the profits of the item till it was long dead. If you want to do like Atari did, you need to have a way of stepping forward as well as back.

What do you guys think.. as far as the ST software goes, use the chip set for making a palmtop/PDA. I always thought a ST version of a Newton would be excellent. :)

Talk soon,
Doctor Clu

7483. Parallel or SCSI?

Newsgroup: comp.sys.atari.st
Date: 2000-06-26 00:00:00 UTC
From: stephenw@operamail.com
Message-ID: <8j889q$o5o$1@nnrp1.deja.com>
Source record: 60399

Does anyone know if a parallel SyQuest drive will work with a 1040STF using HD Driver software? Or will a SCSI only drive work?

I'm looking at getting a SyQuest SyJet for my 1040STF. The SCSI versions are rarer and more expensive than the parallel ones. If anyone is using a parallel drive with their system, please let me know how you did it.

I have a parallel SparQ drive at the office that I use with a PC and I'm going to try hooking it up to the ST. I'll post my results later.

Thanks,

Trenchcoat Steve

Thanks Larry...still learning HTML however.Have to get some more pages up as I got Copyist released. The files are available on the FILE link on my page, but I want to create a seperate page for it.

> For running just midi, or even syncing
> a an Atari to run midi to a DAW would work wonderfully.

You will find a great mant Atarians have done just that. They keep the Atari for Midi applications and sync it to whatever they are using for Digital audio.Many musicians on Atari-Midi (mailing list)will testify to this. Also you can run programs you won't find on PC/Mac like Tunesmith, Ludwig, KCS and even Edit Track!I sort of look at these programs as "modules" in my system. I have 3 atari computers, each running different stuff and I can record the whole thing into cakewalk on the PC!!Or Record everything in Cubase on the TT030 and turn it into WAVE file on the PC to create a CD/MP3 out of it.

I would recommend you keep the Atari to run certain applications.
For answers on this, join us at Atari-Midi . See sig

Well, this would be cool, and it does not necessarily have to be sold through
radio
shack either. There might be a problem getting all the chips that are needed,
but
still a good idea.

>
> What do you guys think.. as far as the ST software goes, use the chip set
> for making a palmtop/PDA. I always thought a ST version of a Newton would be
> excellent. :)
>

Yeah, I had thought that an ST (68000) based PDA would be a cool idea. I am glad

someone else has had the same idea. Actually, the Palm uses a 68332 I believe. I

thought it would be cool to have GEM running on a Palm to allow some of the old
ST apps to work on a Palm. Actually, someone has already prorted Linux to the
Palm
and someone else it working on porting GEM to run under Linux.....now if we could
just Linux/GEM working on a Palm.....or maybe even MiNT for the Palm.

Also, I think a new PDA based on the ST architecture should be doable (I mean
everything inside an ST could be shrunk into a PDA.....well, within reason of
course.....)

The dip switch only enables the "HD" button in the desktop's format dialog
box.

You need (a) a HD disk drive, and (b) a HD-capable floppy disk controller
(preferrably an AJAX). I am not sure if there were early TTs which require
additional modifications on the PCB.

> Failing that, which brands of 1.44 drives will work with the TT?
>Preferably one that won't require me to hack up the front of the case to
>install (it's got the romboid-shaped button).

Electrically, any standard PC drive works fine, as long as you can jumper it
to DS0 instead of the PC-standard DS1. Modern drives use a 0-ohm SMD
resistor instead of real jumpers for this. Otherwise, they work fine.

> 2) it also turns out that the TT has a German TOS in it! Is there
>NVRAM inside the TT which will allow me to go to English, or will I have
>to brush up on my Deutch? :)

There is NVRAM, but the TT TOS is single-language, so you would need new TOS
EPROMs.

From: dwoodw7328@aol.com (DWoodw7328)
Hi to the new guy asking about renaming PC games for ST use!

Glad to see a new user posting something on the group - you're very welcome.
Firstly, PC games can't be played on Ataris - Ataris are old technology
compared to today's PCs. Most Ataris have just one or two megabytes of RAM
onboard and use floppy disks for data storage whereas most PCs have very large
and fast hard drives. Ataris and PCs are totally different platforms just
like Macs and PCs are different to each other.

Ataris use an operating system called TOS and most PCs are based around one
called Windows and they work in different ways so anything you've bought in
the way of software will not work with an Atari.

Sorry mate!
Al

Well, here's my story...

I've got a 14meg Falcon+Nemesis (with the "clock patch" and other CAF related fixes done to it long ago), and use ExtenDOS Gold and the latest CD Writer Suite. I can do 4x when burning data backups with "CD Backup", and 4x when burning ISO9660 CDRs with "CD InScriptOr", but 2x is the best I can get when using "CD Writer" for audio CDs.

I've had numerous e-mail discussions with Roger Burrows of Anodyne Software (and he's been _most_ helpful!), and I've experimented with a few different hard disk drivers (ICD, CECILE, and HD Driver), with varying "top speeds" reported; under both MagiC and TOS; with and without the Nemesis. But I just can't get 4x writes with audio discs.

Bottom line: Roger tells me they're more demanding on the processor than burning data CDRs, and he also recommended a fast IDE drive as the only real way to do it [and for the record, my Falcon's Conner 84meg could _never_ be mistaken for "fast", so it's out of the question!]

And to the best of my knowledge, the Nemesis (or any other accelerator on the Falcon) _will not_ have any effect on SCSI transfer speeds. It will improve IDE drives though.

everything works i want it out of my garage

you get a couple color monitors
a couple monochrome monitors
2 or 3 520 st's (it might even be 4)
either a 1040 or a mega4 (don't remember what is was)
a Falcon - one of the first ones (i opened it to change the hard drive,
changed my mind and when i closed it back up it wouyldn't talk to the hard
drive - i'll leave it to you to figure out)
a bunch of external floppy drives
1 or 2 external hard drives (supra and astra i believe)
books and disks galore

everything for $250
plus shipping (which i'm guessing will be a little less then $100)

The ST is missing some control lines, so no parallel drive will
work, including the SparQ.

Turn dip #7 on, the rest should be off. At least the extra machine
I have here is set that way and it reads HD disks. You may need to
swap the FDC chip for the newer AJAX? I've heard some chips can
handle HD, some cannot.

> Failing that, which brands of 1.44 drives will work with the TT?

Epson SMD-340 or Chinon FZ-357 mechs, the faceplate should fit these.

> 2) it also turns out that the TT has a German TOS in it! Is there

The NVRAM in the TT is not fully used, so as you guessed it may
be a good idea to learn some German. ;)

The NVram should be able to be modified, there used to be an Atari cpx that could modify both Falcon and TT, maybe the Falcon ver is all you need? Most floppy's will work in the MegaSTE and TT they only need to be set to ID0. I mounted a standard 1.44 in My old mega (dip switch 7, but dosent apply to the TT from memory), any way I just milled out the front of the case an flush mounted the drive. It looked quite neet too.

I can't comment on the the extra connector but as far as HDDRIVER is
concerned you can auto boot from the ZIP. You can auto boot from any
removable drive (except for ATAPI drives like the LS-120) just like you
can boot from a hard disk.

>
> I think that that's a wise move :-)
>
> What sort of connector will you use? You'll obviously need some sort of jig to
> keep them aligned whilst you solder. Blobs of Plasticene?

Well, I've finally managed to get all the stuff I needed, and done some soldering. I tested the Eclipse in my non-accelerated falcon (just a Speed-Resolution Card not in use) after the operation and it worked as before, meaning that it showed the same problems of not working alright. This is strange since the Eclipse works perfectly with my friend's unmodified falcon.

I also managed to install it under the CT2. Since this made the CT2 end up a bit higher from the motherboard, I had to make an extension of the 14-pin flat cable that is attached to the CT2's right side.

I also had to cut the small track that runs between pin 20 and 22 of the shorter one of the two connectors on the Eclipse that connects it to the expansionport. You can see which pins in the installation manual of the Eclipse. I believe this track does the same as the terminator that would sit on the corresponding pins of the expansion port. Without cutting this track the CT2 wouldn't work when I tried switching on the computer. But now the CT2 works, although the screen display is a lot "noisier" than before, probably because I had to extend the 14-pin flat cable. This noise I think is because the Blitter can't handle 25MHz, and it disappears when loading NVDI or something that doesn't use the Blitter for its screen operations.

But when I tried using the Eclipse together with the CT2, it showed the same symptoms as with my other falcon. When booting fVDI 0.95 it says that some scratch register test failed, and then it locks up. Version 0.94 of fVDI doesn't do this test, but it didn't work any better after that anyway. For some reason the monitor connected to the Eclipse wouldn't activate, but that might have something to do with my configuration of fVDI. I haven't had the time to fix this properly yet. I'll try again.

Soldering the connectors to the Eclipse wasn't that hard. All I needed was my brother to keep the connector aligned while I soldered the first pin or two, then the connector remained aligned by its own. It was a tedious task of checking to see that all the soldered connections were alright though.

Regards

7510. Papyrus 8 Database

Newsgroup: comp.sys.atari.st
Date: 2000-06-26 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <395722a7$0$31677@news.zetnet.co.uk>
Source record: 60485

Hi

Although this question is directed at ROMlogic I am posting it here with the expectation that Ulli will reply. This is partly to allow people to see the response and partly to tap into others' experience.

I have a database which I have used for years with SuperBase (now the Pro version). I exported it from SuperBase in DBase format and was able to read this into Papyrus and save it as a Papyrus database (*.PB). The data is all there and can be searched, reported on etc.

My problem relates to the validation which was present in SuperBase but which I cannot get to work in Papyrus. I am using two types: firstly, validating entries against constant text (e.g. entry is either 'yes' or 'no'), and, secondly, validating one entry against another (e.g 'year_of_election' greater than 'year_of_graduation').

I have tried inserting various formulae in the box provided but, depending on the formula I am either not allowed to enter text or incorrect text is not detected and reported.

7515. ASM in C?

Newsgroup: comp.sys.atari.st
Date: 2000-06-26 00:00:00 UTC
From: Fredrik Egeberg <deez@algonet.se>
Message-ID: <Pine.SOL.4.10.10006261418360.23464-100000@kairos.algonet.se>
Source record: 60490

Hi

What would be the best way to pass C arguments to an inline ASM piece of code?

as in:
blaha(dummy)

and blaha is ASM code. Now i want to access the dummy variable, i know its passed on the stack but how do i know where? As it seems its different from time to time, caused by different OS calls?

Would this be he best way or can i put stuff into the data (d0-d7) or address registers (a0-a6) from C?

I use Lattice C from single tos.

regards
Fredrik

7516. Re: falcmkX + cd burner

: Hi,
: I've had the following explanation from SoundPool:
: SCSI is too slow to handle 4X burning, so if 4X is to be used, only an =
: IDE-disk is recommended.

Hi there Claes - something still does not make sense to me. For a start, the SoundPool Explanation is not qualified by a more full explanation to make sense. While it may be obvious to some, to me - I need it spelt out!

The three Falcon owners here including myself have for years now written CDs at 4x with the source files being our SCSI drives. The files are typically songs created in Cubase Audio, so
they are files on the Hard Drive (some CDs are data only too). The three of us all have different models of Hard Drive and they are all SCSI. There isn't a problem. It is news to me
that it can't be done, and that you must use an IDE Hard Drive instead!

The newer CD writers have more buffer RAM also - mine is the old Yamaha CD100 with I think half meg buffer RAM, the later ones had 2MB.

Well, I have seen the 2 1/2" IDE drives up to 20gigabyte in size now, so this would be a good
solution no doubt - not to mention the 75 gig in the bigger size. I only wish that Cubase Audio would record onto the IDE drives, it only records onto SCSI.

So I don't understand this issue over the SCSI bus not being suitable for 4x writing, I'm sure it can handle the data transfer rates no problem.

So another thing is I have not checked out SoundPool for a while, but it would be good if they supported the IDE CD writers which are very cheap, and another thing - their re-writable
support was implmeneted only in a minimal way.

I guess I might not understand the situation, but the SoundPool explanation sounds like "a load of old cobblers" to me. I think a more technical discussion is in order to justify that
claim - it may well be other issues - one thing I do know is that the SCSI bus can transfer the data and heaps more than what is necessary to keep a writer going at 4x speed. One can test the SCSI bus to see how much data it transfers for a start...

> either).

I have found the FAQ on this subject to be useless. Dont get me wrong the FAQ may help someone wack the heck out of a floppy drive but, thats not what I want to do. I want something that can accept the faceplate and be used without worrying about damaging something or something coming unglued. That is why I asked about the SMD-300. The drives in the Atari computers are just like anything else, there is a replacement for them its just finding the correct one.

Don

Yes, but maybe not for everybody (not for the scientist, for example) -
so you can do this on your own by making templates.

And in Papyrus 8.5 (coming soon, free for all English customers of
version 8) there will be a menu option "Favorites", where you can put
such templates in.

Hm - I didn't understand fully, I'm afraid (maybe a language prob,
but I don't think so X-)).
Do you want to check an entry wether it fits into your (database)
needs or not?

This can't be done in the same field, at the moment (but I guess
it will in version 8.5, coming soon free of cost).

You have to make another field like an alert field, where you check
entries against a validation. But, as I said, v. 8.5 will have more
functionality for that, it will come up with action triggers with
related formulas.

TOS 3.05 will read only 770k diskes: you need TOS 3.06 and a new floppy
driver to read 1.44k disks.

>> Failing that, which brands of 1.44 drives will work with the TT?

That is not totally true. If there was a decent emulator for the hades or
Milan, it could be done and done well. Both machines could do the graphics
to a point, but the edge goes to the Milan for compatible sound as it's PCI
bus is more upto date and even with the PC world. I have have ran simple PC
games on my ST. They run fine and the graphics were fine, it is just that
things ran alittle slow.

Hi there,

I have been able to get my friend's Crazy Dots Card working, but there is a problem. Everything is fine until I try to display a 256 color picture. The graphics look funny. Things clear up if I push in on the video connector on the card or else move it up or down. I think it is loose connection, but could it possible be something on the card itself?

Hi,
You need to supply TERMPWR to the Link, which isn't provided by the Zip-drive. The TERMPWR is what gives the Link it's power - it surrounds us, penetrates us and binds the gal... uh, sorry - got on a small side-track there... ;)
This can be done in two ways - either by connecting an external harddisk or CD-ROM player after the Zip drive and plugging a terminator in it (with the termination on the Zip off). Then the last unit in the chain supplies the needed TERMPWR - or you can do it by conneting +5V from a port (the joystick port is rather commonly used), to the TERMPWR pin in the Zipdrive's Output connector. I don't have the pinout at hand now, but I'm sure someone else has...? Otherwise, it should be rather easy to search for the SCSI standard pinout on 25-pin connectors...

Best regards,
Claes

The Favorites menu sounds great! Another solution I thought of trying to do for myself, was to create an openning page that comes up with lists of Standard Letter templates, Label templates, etc. in Hypertext form, so you can just click on the type you want (just like web browsing) and it brings up the right template. This is how my mother-in-law's Microsoft Works (I'll have to wash my hands after typing that!) deals with the problem. It first shows a list of different genres of templates (letters, labels, flyers, etc.) complete with flashy graphics, which Papyrus is definitely able to do. You then click on a hyperlink, and it brings you to a page with specific templates. For example, when you click on "Letters" it will show you links to form letters, personal letters, business letters, etc. also with graphic representations of each. Very elegantly laid out, but also should be quite easy to accomplish with Papyrus, if you have the time and can create all the templates, graphics, etc. Maybe if I have the time, I'll try to make a page that imitates this and either put it on a website or give it to ROM if they'd like to include it in their package.

My apologies if this posted twice!

Hi All,
Can anyone shed some light on why Newsie.96 is crashing on my stock
Falcon MKI (14 meg)? No crashes with Newsie .94!
Happens with or without Wdialog (using Wdialog 2.04, looking for 1.96).
Lock-up happens mostly if I bring the mouse curser to 'Load Preferences'
without clicking on it.
Auto folder Prgs:
NVDI (5.01), latest StinG pkg., Hsmodem7, Extendos Gold, JPEGD,
Macel34, Sockets (for CAB 2.7), with or without Wdialog.

John G.

Hi all,

problem with Atack's Amail.

Looks brilliant, but when I come to dowwnload, (get) mails, they all
seem to arrive (red bar fills up), then I get message 'last message
could be corrupt', all mails seem to disappear and then a message 'Error
while importing messages. Messages stay in
D:\AMAIL\AM_TEMP\recvbox.tmp'. A message does appear of that name.
What's wrong please?

Bob King.

I have the same problem also on an 48 Mhz accelerated TT030
using NeoDesk 4, Geneva, and NVDI 5.03.

I bet there is a mistake in compiling it?

> have been ported to run on the Amiga and 68k Mac's. It just takes someone
to
> sit down and compile to code to run on Atari.

You are totaly wrong here. The main-problem is, that all the emulators like
Basilisk, Mame, UAE and so have a buildin CPU-Interpreter for the 68k-code.
This make these things totaly slow on m68k-machines like the MilanII or
Amiga060.
The funny thing with Basilisk is, that you can use your buildin Hardware-CPU
without any translation (there is a special mode to compile the thing so,
but
it would not be easy to port this to the milan).
The emulator builds only the IO to the keyboard or to the display.
So you reaches the speed like your CPU and with an 68060/50 for example you
are
3 times faster than an Quadra605.
You can with this play games like Dark Forces etc. and you can use, if you
are
hot to do so, Microsoft Office :).

Bye, Andreas

7544. cubase audio bombs

I've had not too dissimilar problems with 0.96 too - I've reverted to
0.94. I too have a standard Falcon, with all the usual stuff, e.g.
NVDI, WDIALOG. I got system lockups when pointing the cursor at a
menu item that has a pull-down sub-menu.

I had big problem on my Hades 060 to get it working
so i was forced to go back to 0.94

It is locked-up or crashed directly in both TOS and MiNT.

>my ST with a scope and it clearly reads somewhere around 4.16Khz.

Presumably this is the actual 'click' frequency within the 'chopped'
square wave? The square wave itself will be only a few Hertz if you can
talk about a frequency at all (you can if you hold a key pressed)!

>You're probably thinking that this is HF, yes to some extent, BUT it
>is square wave. Square waveform is rich in harmonics and will contain
>low frequency and mid frequency hidden in it. Thats why it's thumping
>our speakers out even though it sounds quite high pitched.

No, that can't be right - the harmonics of a square wave are all
higher than the fundamental repetition frequency, not lower. I think
you are confusing the frequency of the click itself, which may well be a
few kHz, and the keying of it at a few Hz if a key is held down
(repeating click). It's more likely that the low-pass filtering of the
crossover causes the envelope of the square wave to be reproduced; could
also be the fast rise-time causing ringing in the crossover.

Regards, /Peter/

Don't spoil your time with this version. It just don't work.
I've tried it for a few minutes on my Hades 060 running freeMiNT/N_AES.
Total disaster.
Use Newsie 0.94 or another mailer instead.

Hi,
I haven't seen this specific problem before. You've only tried to record on the SCSI-drive, which should work. I would suspect that you need to make a CPU-clock patch, but it seems strange that it's worked ok before...
Is there such a clock patch made? If it has been made, it might be if you forgot to plug in the SCSI termination or something simple like that...?
Another thing that might have happened is that the Powersupply got overloaded - or that heat builds up inside the MKX box - maybe you could try installing an extra fan which draws out some of the heated air (try first by removing the top cover to get a free air flow and see if it gets any better) - or to supply separate power to the IDE-drive?

Rumour has it that the SyJet parallel drive is really a SCSI drive with a special cable. Someone reported on the 'alt.syquest' newsgroup that he was able to use a 25-pin SCSI cable on the "parallel" drive without a problem.

Hi all-

Hate to "disappoint", but Newsie 96 (almost always) works fine
for me. The only time it has NOT, was when I tried to delete an
email that wouldn't finish coming thru (using "check mail", then
clicking on the delete button), and that bombed the computer.
However, I haven't had the problems I've read about in your
posts. Not sure what's causing the explosions, but my set-up is:

Falcon/ 14 meg/ ICD/ Toshiba 2.5" IDE/ Warp 9/ TOS 4.04/ Nemesis/
No NVID or Magic or Mint

Don't know if that helps, but I hope it does-

7556. CAB problems

Newsgroup: comp.sys.atari.st
Date: 2000-06-27 00:00:00 UTC
From: osian@zetnet.co.uk
Message-ID: <395929f4$0$31677@news.zetnet.co.uk>
Source record: 60444

I had to reinstall CAB a few weeks ago, due to a corruption problem, and since then it hasn't been able to display JPGs. It either bombs out when trying to display them or, if I delete CAB_JPEG.OVL, it displays the page but with the ALT text in place of the image.

I suspect it might be the CAB.OVL file, as in reinstalling I lost the version that I'd painstakingly found to be the only one that worked. I've since downloaded several versions and have settled on the only one that doesn't cause CAB to crash on loading. But I have this JPG problem.

First of all, can anyone suggest what might be causing the problem?

And if it does appear to be the CAB.OVL, does anyone have a version they could email me that works with CAB 2.7 on a Falcon?

I'm also confused about the CAB_JPEG.OVL. I'd always assumed that it was just another version of the OVL that maybe optimised the loading of JPGs, but had to be renamed to CAB.OVL in order to use it. With my experiments, it seems to be active even if you leave it with its original filename, and that it works in conjunction with CAB.OVL - is that right?

TOS up to 3.05 will read only 770 k; you need TOS 3.06 and a new floppy
drive to read 1.44 K. Changing the dip switches doesn't help otherwise.

>> Failing that, which brands of 1.44 drives will work with the TT?

Can't answer that, sorry: my supplier installed an appropriate brand
(whose name I don't know), without cutting up the case!

Don,

Actually the drive Atari used was the SMD380. I still have a NEW one in
the Atari parts cabinet with the custom Atari faceplate already mounted.
You can have it for $30 plus shipping. Reply in Email if interested.

Sheldon

Hi all

Same goes for me too, no probs whatsoever with Newsie .96
Could it be NVDI? I'm using 4.11 but Martin and Erik are using
5.x if I'm not mistaken. Just an idea.

Hi Chris

CAB_JPEG.OVL is exactly what it says, an overlay for Jpg's, it has
nothing to do with connection towards internet, for that you should
have the normal CAB.OVL.

7563. Re: cubase audio bombs

Newsgroup: comp.sys.atari.st
Date: 2000-06-28 00:00:00 UTC
From: Mark Bedingfield <mark@baypc.com.au>
Message-ID: <ulf65.314$2q.6117@nsw.nnrp.telstra.net>
Source record: 60359

The ide drive is not recordable as far as cubase is concerned, you can run it from the ide but the data must be stored on a scsi drive. The C-lab falcon's do not need clock mods as c-lab sorted all that drama out. Only early Atari machines did...

Chris,
Either Oliver's 5.68 or Dan's 1.4008 work on my stock Falcon MKI
Neither crashes but behave differently depending on the site
CAB (2.7) accesses.
Dan's versions found at:
http://www.netset.com/~baldrick/ovl.html
Oliver's at:
http://obooklage/free.fr/sti_cli.htm
The JPEG.... should be left as is (and in the modules folder).

If you need 2.04, E-mail me! No DOCs and can't recall where I got it from
but loads as WDIALOG 2.04
Version 2.00 was but is no longer available at an AOL/DirkHage site
(w/docs and programming info) I have some of that stuff if needed.
Can't help with the link.

Hi Tim,

I considered doing just what you suggested. But I have found pretty good success running most everything from one machine, though sometimes in a buggy fashion. Recently obtained Gigasampler and have it running on one machine with Logic Audio. I have all the other apps one might see in a DAW as well. Generally, it's quite adequate. I really didn't want two or three machines around. When and if I do, unfortunately, I'll need something with alittle more power. If I had a bunch of time to burn, I'd love to get into some of the Atari programs, particularly KCS. It was extremely powerful for it's time....almost too powerful!

If I were to delve into this, is there an app where I could download an app to a floppy on my PC and then run it off the Atari?

Thanks again,

Larry

Yes. Woller Systeme in Berlin has a cartridge port adapter as well as
drivers for parallel-port ZIP drives and Connectix QuickCams.

AFAIR, there is also a version of the ZIP driver which works on a Milan
without extra hardware, but I am not sure if that was released or not.

was extremely powerful for it's time....almost too powerful!

Yes..KCS with PVG you won't find on any PC/Mac Sequencers.There is also
an update you can get from Emile Tobenfeld (dr T) that allows more
interactive stuff in SONG mode.

> app to a floppy on my PC and then run it off the Atari?

If you read my Download FAX at

http://sites.netscape.net/timconrardy/timidi.htm

It tells how to download Atari software. Basically you just unzip the
program to a 720K Dos-Formatted disc (not a disc that has been
formatted on the Atari desktop.)and put it in the Atari drive. Simple
as that.The problem is finding 720K discs. If you try to format a 1.4M
disc to 720 on the PC, it might work for a while, but the format is
different and you might loose data.

Tim

Obvious it is but it breaks the sorting routines of the newsreader (and it isn't conform to the RFC).
I sort the message by subject. AFAIK all the descent readers are instruct to disregard the leading 'Re: '. This way the original message and all the replies are placed under each other. Every decent mailer regards 'SV: ' as part of the subject. Ergo, wrong sorting.

I don't think (not sure as I'm not a pc-user at all) that the reader you use can sort the messages the way Okami or ASH mailer - which are IMHO much better then that Micro$oft crap - does, otherwise you'd have seem the problem yourself.

Indeed it works on plain TOS but for heavens sake we live in 2000 and not in 1986. It should work with a multitasking system.
Newsie 0.94 works fine on my Hades so why refuse 0.96 to work properly with the same setup? There is obvious something wrong.

Hi

As a matter of interest I have a selection of Atari magazines and Pokemon card up for auction of ebay UK.

Including Exfile 'the Protext user mags' and 'Timeworks user' mags, of which cater for all formats/machines that
Protext/Timeworks was released on!

Use the following URL for a list of what's on offer, some of these are going to be collectors items:

http://cgi6.ebay.co.uk/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=the-atarian&include=0&since=-1&sort=2&rows=25

Hmm, tin manages this without problem...

> isn't conform to the RFC).

I don't think this is a part of the RFC, but I could ofcourse be
wrong. The correct way to sort messages/display threads properly is to use
the message ID.

> I sort the message by subject. AFAIK all the descent readers are instruct
> to disregard the leading 'Re: '. This way the original message and all the
> replies are placed under each other. Every decent mailer regards 'SV: ' as

If your newsreader used the message ID you wouldn't have this
problem. And instead of getting just a sorted list of the replies, you'll
see a three which tells you who replied to who.

> http://www.netset.com/~baldrick/ovl.html
>Oliver's at:
> http://obooklage/free.fr/sti_cli.htm

Thanks - I'll try Oliver's (with the correct address!) as I've already
got 1.4008. However, this certainly wasn't the CAB.OVL that I
originally had as I've never had to put a .CFG file in. That might be
the difference.

BTW I've tried disabling all my auto programs and accessories and
booting with a clean machine, and CAB then reports

Runtime error 165 at offset $000B57FA

when trying to display a JPG.

> John G.

Hi John. You will have to get me up to speed. Did NEWsie .96 get a full release or are you using the beta? If you are using the beta, I can assure you it will work on a 14 meg Falcon.

Now I can't tell you the difficulties I had getting the program to run, considering .94 was pretty straightforward. Once I got it to run, it has worked as flawlessly as .94.

Yeah, I am on ASH at the moment. Mainly because it doesn't lose the messages in long threads, which is a characteristic of NEWsie that I didn't enjoy. Short threads are fine, unfortuneately I was hoping .96 would work better in this regard.

Give me time to boot up the Falcon, and send me some emails to remind me too:-). Then I will have a look. I just need to remind myself of what I did to get it to work like .94. It sure was a pain in the butt. IIRC in plain TOS the TOS file Selector dissappears. Lots of quirks etc. But that was in the beta I had since last November.

I am interested in this subject. So bug me.

Later Brian.

Hi all,

I've just bought CD Recorder Pro, but it's lacking LFN support, and I can't see that Soundpool's latest version supports it either.

Is this something which is never likely to appear, is their anyone working on adding this functionality?

Granted, I could use ZIP20 to archive my LFN partitions and burn those to CD, but it does rather defeat the object!

sender's name.

>Hmm, tin manages this without problem...

No, it doesn't. If you have the following subjects:

Why do you do this?
Very Good!
SV: Why do you do this?

Then the sorting order will be:

SV: Why do you do this?
Very Good!
Why do you do this?

But, obviously, "Why do you do this?" and "SV: Why do you do this?"
belong together, and "Why do you do this?" should come first.

>I don't think this is a part of the RFC,

From RFC1036:

If the message is submitted in response to another message (e.g., is
a follow-up) the default subject should begin with the four
characters "Re:",

>The correct way to sort messages/display threads properly is to use
>the message ID.

I beg your pardon? You cannot sort by message IDs. You can only sort
threads properly if a "Reference" or "In-Reply-To" header field is
present. But if it isn't - and it isn't always - you have to rely on
the subject.

>If your newsreader used the message ID you wouldn't have this
>problem. And instead of getting just a sorted list of the replies, you'll
>see a three which tells you who replied to who.

The newsreader Martin Byttebier uses does both.

No - GIFs display fine, I only get the text instead of JPGs when I
rename the CAB_JPEG.OVL file. That makes sense of CAB relies upon
that file to display JPGs. If I keep the file with its original name,
CAB crashes.

I have read the docs and am aware of the compatibility problems.
However, I have WDIALOG 1.9x whatever, whereas Newsie has problems
with v2. Also, If WDIALOG 2 is used, Newsie just ignores it
according to the docs.

Apparently not (and it's not the first time). But tin displays "broken"
threads - where the subject is changed - perfectly, whereas some other
newsreaders I've used (like OE and ASH Emailer) don't.

Sorry but I won't do this simply because the author doesn't care much
about bugreports.
Some serious bugs has been reported (not be me) almost two years ago and
yet they are still there.

Hi are we back in the middle ages or what? In case you don't know we are
living in the 20th century (almost 21th).
Newsie should be able to run with all the modern stuff we are using these
days on our platform.
I using a mulltitasking system, with NVDI and all kind of other goodies
since 1996 without any problem. All the progs I have do run quite happely.
Only Newsie 0.96 behaves very bad.

BTW: Wdialog doesn't make any different. With or without Newsie keep
crashing.

Oh, Okami does show me the thread tree and in this matter I don't have
problems with SV but if sorted subject afabetical the sorting is
completely wrong.

Sorry, I didn't realise that pointing someone to a fault is against the
rules.
Remember in my first message I've ask you if you could change it.
My second reply wasn't pointed to you but directed to someone who didn't
see why it's wrong to use "SV:"

>sure I've missed changing it a few times before. As someone said, it's pretty
>obvious what it means, as the rest of the subject line is still there, so it should
>be rather easy anyway...

Easy it is indeed but it's rather annoying to search all over the place to
find a reply. My reader can sort in all possibles ways and I want to use
these functions.

>Furthermore, I don't understand why people are always complaining about "M$ crap" -
>especially you when you state that you're no PC user (how can you ever start
>complaining about software you say in the same meaning that you don't use
>yourself?).

Indeed I'm not a pc-user but I do have eyes in my head. The rfc requires
that the reader use "Re:". All the readers I know do use it except
Outlook Express. Breaking the rules is something Micro$oft is good in.

>being developed and enhanced. However, I still enjoy helping people with their Atari
>problems because I believe in helping each other instead of nagging about details.
>Please return to the Atari discussions instead of this kind of nonsense...

Again, my first message wasn't intend to attack you. I only wanted to say
that 'SV: ' can cause problems. That's all. Nothing more nothing less.

Hi Ken-

Logic Audio has been available for quite a long time now. However
you do need all the extra files that you would have if you
already had Logic (non-audio), and you need the LOG-3 dongle.
Or... what's available is ONLY the program file.

ftp://dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI/

I think you want: LAF0601 They have a compressed and an
uncompressed version on the site.

I didn't know CAF was released for download. Do you need a dongle
for that one too? Where is it? Maybe the same site as LAF?

7613. Re: CAB problems

Newsgroup: comp.sys.atari.st
Date: 2000-06-29 00:00:00 UTC
From: osian@zetnet.co.uk
Message-ID: <395b9c04$0$31677@news.zetnet.co.uk>
Source record: 60314

Well, strangely enough, the problem is now fixed!

I decided to do another reinstall of CAB, and try to take the configuration step-by-step so I'd remember what I was doing.

There was no CAB.OVL supplied on the installation disks, so I copied over the latest one from Dan's site, and it worked first time!

Don't know if it makes any difference or not but this time I *didn't* choose to install all the CAB 'extras' supplied on the disk, like Olga, Fiffi etc.

Another small problem has surfaced though - I have an animated GIF on my home page with a transparent background. This is no longer displaying properly, the background is the wrong colour. This might be a fVDI/Eclipse problem as this is the sort of thing that fVDI would get wrong before some of the bugs had been ironed out. However, I still have my old installation of CAB and it just so happens to display the GIF correctly!

I'll never understand computers...

Many thanks to everyone who replied.

I take that back! In my old installation, I'd set the background
colour to white. A new installation defaults to grey. The GIF
displays properly with white, but not with grey. So it seems it's a
problem with fVDI.

"AIUI"? Care to refresh my memory on the meaning of that acronym?

And yes, I realized that. But I used a small amount of contact cleaner on a
cotton swab to take off the surface grime that had built up. There was no
heavy handed polishing involved! :^)

Now when I clean the contacts for the drum pads of my Alesis HR-16 drum
machine, that's a different story. Polishing is definitely required!

But I gotta say, even though the Falcon's keyboard is a bit of a pain to
disassemble, it's _great_ to have a fully functioning keyboard again!

Interesting. I noticed this trick didn't work for me after reading your
post and trying it again. It did work the first few times I tried it though
(making sure to clear the cache and delete CAB's cookies first).

Either way, just put in any e-mail address. It'll still let you download.
And for any site that asks for an e-mail address up front, I recommend any
combination of the name "John", any 2 numbers, and "@aol.com".
It hasn't failed yet - although I imagine a lot of Johns are getting more
spam than they should be. But then they probably deserve it since they're
dumb enough to pay $22.00+ USD per month for a bloated and slow "ISP" like
AOL!
;^)

>Um, what's that got to do with atari anyway? :-)

(1) I'm an avid Atari supporter and user, and created all the music
originally on my Falcon with Cubase Audio (and some outboard MIDI gear
of course).

(2) I mention the Falcon in my equipment list on my MP3.COM pages. ;^)

(3) I thought perhaps other Atari users might be interested in music that
was sequenced and recorded on our favorite platform.

Stripping a system down to its barest components
is the first rule in trouble-shooting complex
systems like a computer. Remove all unknowns.
If CAB has a problem in plain TOS, it surely
won't work with other system enhancements active
at the same time.

I'm well aware of that! Which is why I tested CAB with a completely clean machine - disabling all auto programs and accessories, and it still crashed.

Now I've got it working by reinstalling again, there was this apparent problem with the display of one particular GIF - and the problem was diagnosed by changing the background colour from grey to white, not by disabling everything again, and doing multiple reboots etc.

Martin,
Re: Middle Ages
I'm not quite sure what prompted your response. You must be
referring to blood letting and blood sucking leaches to cure Bubonic
plagues!!! (:->)~ And yes, Newsie 'should' run happily right out of the
box without all this playing around but It's working now without that
much of a big deal (thanks to good feedback from this NG!).

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your looking for my Free catalogs, skip to the bottom,otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet and some Cartridges for the ST like DVT VCR Hard Drive Backup, ST Replay & Computer Eyes! So come and Get it!

e-mail: atari@benjamin.net

To take advantage of Discounts, FREE Monitors or FREE Jaguar Cable, you must E-Mail me to Claim it & state what you want in E-Mail.Be specific!

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega ST2 or 1040STe & receive a FREE ST Monitor. Your Choice of a Color or Mono-Chrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or a 130XE and receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 worth of Atari Jaguar items, receive absolutely FREE, a +NEW in the BAG Jaguar Stereo Audio/Composite Video Cable.

Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the

Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

> problem yourself.

Whew! A whole lot of meaningless babbling about nothing.
Such a roit for a simple typo - don't people have Atari matters to discuss in the group instead of complaining about simple errors?
As I'm swedish, my OE is set to use the swedish abbreviation for "Reply" - and this time, I missed changing it (Yes! I know that I can change it permanently, but changing back and forth when attending various newsgroups and mailing lists is too boring, so you'll have to live with an occational error if you want me on the list).
Big deal - I've attended this group for quite a few years and I've helped a lot of people around the globe with their Atari and music related problems - and I don't remember anyone complaining about such things in this group before - and I'm pretty sure I've missed changing it a few times before. As someone said, it's pretty obvious what it means, as the rest of the subject line is still there, so it should be rather easy anyway...
Furthermore, I don't understand why people are always complaining about "M$ crap" - especially you when you state that you're no PC user (how can you ever start complaining about software you say in the same meaning that you don't use yourself?). I've used various browsers and mailing programs and the ones I keep using are M$ Explorer and M$ Outlook Express. They're very well functioning and it's actually hard to find things to complain about. I also use Windows98 and other M$ programs on my PC and I never have any problems, so spare me the "frequent crashes" stories... My Falcon works fine - but I only keep it for nostalgic reasons - my PC does everything the Falcon ever did, but MUCH faster and with software that's still being developed and enhanced. However, I still enjoy helping people with their Atari problems because I believe in helping each other instead of nagging about details.
Please return to the Atari discussions instead of this kind of nonsense...

Best regards,
Claes

>
>
>.
Hi Again,
This was posted with Newsie .96 !!! *** No NVDI (5.01) ***.
Everything else the same as the set up I mentioned. As a note also,
I used the same Newsie set-up files (prefs inf, etc.) as I had in .94
with this post and when .96 crashed. I need to play with the NVDI
compatibility choices and set .96 up from scratch to see if there's

a difference. So, so far, to me it looks like an NVDI 5.01/NEWSIE .96 compatibilty problem!
John G.
P.S. How's it goin' Brian? Not sure if this is a beta or not but I got it straight from John R's site as the latest release.

Ahh! The infamous 'run time eror offset'! I have'nt heard of that
in a good while. I've just about always had a CFG file with Dan's OVL.
Oliver's has a SET file. I disable one when using the other.
Sorry about the (/) instead of a (.) I'm glad there is'nt a RED button
near the two (:->)~

That is really strange, Martin. My version of Outlook Express does use
"Re:" and I have seen no way to customize that. So I really don't
understand where the "SV:" comes from.

But if there is no thread information, and the subject has changed the
way we are talking about, then tin has no way of grouping like
messages together.

As for OE: I wonder if I'm the only one in the world with a version of
Outlook Express that works absolutely correctly. Yet, the version I
use is just the standard one distributed with Windows 98. Threads are
not broken in my version of OE, even if the subject has changed.

I Have for auction the official hat made at the Las Vegas Atari Falcon convention (I think in 1993). They had a machine that was hooked up to the Falcon embroider the letters "ATARI" on the front of the hat.

Hi :-P

There exists for the Atari ST a Software Emulator called PC-Ditto (runs DOS-Text based programms at 'nice' speed but graphic Games 1000 Times slower) and there exists some Hardware-Tools to Emulate MS-DOS PC's example PC-Speed or AT-Speed (this is a little PCB Board that must be soldered on the 68000'er Processor) that runs old Programms and Games at a very Nice Speed! (For a Time I had PC-Speed... Emulates CGA Graphic and ~10 MHz CPU)

Bye, Henning

Oke, I've it working now. I need to switch off the GDOS buttom in the
nvdi.cpx. That's not exactly a good solution. I'm glad I'm only using
Newsie as test.

Now I wonder why Newsie has problems with NVDI. This is something I don't
understand quite well. NVDI is de-facto a standard on the Atari-platform.

LFN stands for long file names. MagiC (and its variants) and MiNT supports
LFN nowadays. In case of MagiC a LFN partition is a VFAT one. With MiNT
you've the choice between VFAT, ext2fs and minix.

SV: is "Svar" in the swedish version of OE.
Yes this is invented by M$ to break one of the rules
and they add new things in every new version to destroy
for other clients.
For every new version of mymail i have to add
a new "workaround" needed to deal with OE.

MyMAIL can handle these "SV:" in the mail
but the news part is not finnished yet.

This is not nonsense, MS is breaking the RFCs describing how to handle
mails and news.
This makes it hard for other mail/news clients to deal with
mail/news from OE.

Hi,
Please notice that I remembered changing to "Re:" this time ;)
I believe all countries have their own abbreviation for "Reply" (which is the approved standard for those countries), so there are a lot of different replies around - Sv for "Svar" in Sweden, Antw for "Antwort" and I'm sure a lot of others. It's only the english versions which don't make a difference between the english and the local "Reply" (well - the reason is pretty obvious, isn't it?)...
There are some settings for this in OE, but it's a little tricky to find them (since I have the swedish version, I've tried to make proper translations...):
Tools - Alternatives - Send - International settings.
Here is a checkable box "always use english headers when replying".
The choise above this box may also be important "standard coding for outgoing messages", which among other things can be set to the default, which is "western european (Windows)" or "western european (ISO).
I could easily set my OE to use the english standard reply, but then all my swedish contacts would complain about me using an english version, so I simply won't do that...

Hi,
It seems like it's time for a small fairytale - a story that's all too familiar for most people...
There was a time when there were 4 different video formats. After a while Video 2000 was sorted out as giving the best quality. The problem was that VHS was a too heavy competitor, with a lot more rental films out on the market. One thing lead to another and in the long run, only the VHS format survived, so all the manufacturers simply had to adjust to this fact of life.

Maybe it's time to stop complaining about M$ and adjust to their stuff - since a huge majority of the users around the world actually use OE - in spite of people trying to convince them about how bad Micro$oft products are... Since they've found that the products do what they should, they simply can't see the reason to try something else. Maybe Micro$oft found a better way than the way the specification was written from the start...? I have no knowledge about this, since I'm a simple user who's already found out that OE is what I need and can't find any reason to change. For those who are curious about how I know which programs are in majority, I can see in my statistics that about 70% of the visitors on my website use some version of Explorer (mostly IE5) and about 85% use Win95, 98 or NT...
Accept the truth instead of fighting the majority - that's my humble opinion, as long as the truth isn't totally unacceptable (which it certainly isn't in this particular case - not if you ask me anyway)...

Best regards,
Claes

Hi Claes.
This does not apply as the standard was not set for video
formats at that time, so that was open to all the options and
VHS had the best quality/price from all the options, so that was
a fair competition.

reason to =
>change.

It's fine that OE does what you want, but when living in
community (like the INTERNET), there are some rules to follow
for everyone to take part of the community. Going against the
rules is a disrespectful attitude to all who follow them, its
unkind and nothing to take lightly.
Why should all of us (and all who doesn't use MS products) adapt
to every arbitrary change of the products used by the majority?

This only reflects that there is a majority who does not respect the minority right to choose, and just want to impose their own rules.

This is something I cannot accept.

sorry, ain't no sheep, but a person.

For those who are curious about how I know which programs are in =
>majority, I can see in my statistics that about 70% of the visitors on =
>my website use some version of Explorer (mostly IE5) and about 85% use =
>Win95, 98 or NT...

Yeah! 85% of the population has some kind of herpes virus... Is got to be good then.

>Accept the truth instead of fighting the majority - that's my humble =
>opinion, as long as the truth isn't totally unacceptable (which it =
>certainly isn't in this particular case - not if you ask me anyway)...

We are all entitled to our own opinions and it's good to discuss about. Now... to loose the right to choose and make my own desitions to follow the crowd is in my humble opinion totally unacceptable, but of course... that is just me.

To equalize: truth = what the majority thinks it is to decline your right to choose, deny your own personality and finally give up your own freedom.

Too heavy for a discussion about newsreaders? Well... you started!. ;)

All the best.

Daniel.

Yes I do care about bug reports, but I hae a limited amount of time to
find bugs reported by others that I cannot duplicate on my system.

```
The utilization of AES attached-menus can be turned off by adding 'N's
to the experimental line in the preferences. This is experimental,
and as such, I did not add an edit dialog. Just try
experimental<tab>NNNNNNNNNN<return>
in the prefs file and the old pop-up menus should return instead of
the AES attached-menus.

I don't know why it sometimes works and sometimes not. I suppect
corruption, bu have not been able to successfuly find the problem.

Thanks for the info.

On another note, how does 2.04 differ from 1.96? I hate playing
with working things.

O.K., having made 5 EBay purchases over the last few months I
can come to a few conclusions:
#1 -- Syquest's quality control really seems to have died off
the last few years. My two EZ135 drives both were plug and
play, but I had a bad Syjet drive AND a bad Syjet cartridge
(both new in shrink wrap). With replacements of both I'm
finally running.
#2 -- ICD utilities can indeed run Syjets.
#3 -- There is no difference between the Syjet external SCSI and
the external PP except for the cable supplied. Buy either and
get a SCSI - SCSI2 cable.

LFN - Long FileName. As used by MagiC, MiNT etc.

I thought I read that someone in here was developing a module for this.

Yes, it's swedish, and means "Svar", which is the word for "answer".
It's used by some programs like MS Outlook, Eudora and possibly
Netscape and IE, which have swedish versions. I think it's an awful
idea.

The mailers that use this, do strip the "SV:", but most other mailers
don't, since they only know about "Re:", they get left in the subject
anyway, and the swedish mailers aren't clever enough to strip both
"Re: SV:".

It's probably configurable in at least some of these mailers, but
people don't seem to care enough.

Tomas

> for that one too? Where is it? Maybe the same site as LAF?

Try Steinberg's own download ftp site (which has been changed a couple of times - but for the moment it's this):
ftp://ftp.steinberg.net/download/atari/cubase/
Of course, you'll need a dongle for it.
